

1. The decline of salmon fisheries along the Columbia River in Oregon has caused great concern among commercial and recreational fishermen. The paper "Feeding of Predaceous Fishes on Out-Migrating Juvenile Salmonids" gave the accompanying data on y = maximum size of salmonids consumed by a northern squaw fish and x = squawfish length, both in millimeters. The accompanying data is from MINITAB

The regression equation is
 $size = -89.1 + 0.729 \text{ length}$

Predictor	Coef	Stdev	t-ratio	P
Constant	-89.09	16.83	-5.29	0.000
length	0.72907	0.04778	15.26	0.000

$s = 12.56$ $R\text{-sq} = 96.3\%$

- a) Interpret the slope in context of the problem

- b) What is the correlation coefficient?

- c) What value of maximum size would you predict for a squawfish whose length is 375 mm?

- d) What is the residual corresponding to the observation (375,165)?

- e) What proportion of observed variation in y can be attributed to the approximate linear relationship between the two variables?

2. A study measured the heights of husbands and wives to see if there was any relationship. The mean of the wives' heights was 64.5 inches with a standard deviation of 2.5 inches. The mean of the husbands' heights was 68.5 inches with a standard deviation of 2.7 inches. The resulting correlation was 0.5. Find the equation of the LSRL to predict the husband's height.
