### Abstract

*The vertical deflection of a simply supported and clamped beam is considered under a uniform load using the finite element method. The problem is solved using homogenous and non-homogenous boundary conditions with various numbers of elements. The governing differential equation is that pre-described by the Bernoulli beam which is a fourth order differential equation. Cubic elements are used as required for continuity. Graphs are presented and discussed for different loads in each case.*

**Keywords:** Finite element method, Beam equation, Homogenous and non-homogenous conditions

### 1. Introduction

Beam equations have historical importance, as they have been the focus of attention for prominent scientists such as Leonardo da Vinci (14th Century) and Daniel Bernoulli (18th Century). Practical applications of the beam equations are evident in mechanical structures built under the premise of beam theory. The importance of beam theory has been outlined in the literature over the years (see for example [3], [4], [5]). Examples include the construction of high-rise buildings, bridges across the rivers, air craft and heavy motor vehicles. In these structures, beams are used as the basis of supporting structures or as the main-frame foundation in axles. Without a proper knowledge of beam theory, the successful manufacture of such structures would be unfeasible and unsafe. The Euler-Bernoulli beam theory, sometimes called the classical beam theory, is the most commonly used. It is simple and provides reasonable engineering approximations for many problems. In the paper, we shall illustrate the use of the Galerkin Finite Element Method to solve the beam equation with aid of Matlab.

The Finite Element Method (FEM) is one of the most powerful tools used in structural analysis. Finite Element Analysis is based on the premise that an approximate solution to any complex engineering problem can be reached by subdividing a larger complex structure into smaller non-overlapping components of simple geometry called finite elements or elements. Complex, partial differential equations that describe these structures can be reduced to a set of linear equations that can easily be solved using this method.
