

Particle Interactions:

What does a force exerted on an object do? It changes the momentum (velocity/energy) of an object.
 - **Force = velocity**
 - Force does work on objects, they exert equal and opposite forces on each other.
 - Transferred between the objects by their forces, if an other force acts on them.

Force in Fundamental Interactions

What affects all matter - always attractive
 - binds the nucleus together - also known as strong nuclear force (strong interaction, short range)
 - responsible for the radioactive decay of atoms (short range)
 - vector: a type of physical interaction between elementary charged particles (Attractive/repulsive)

Why does force (attraction and repulsion) happen?
 - Physics suggested that electromagnetic force was due to the exchange of **virtual photons**

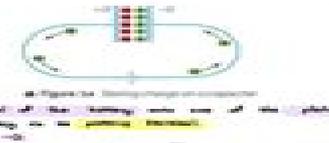

The closest thing a ball to not other means than to repel, as the ball transfers momentum from the one another, the people represent macroscopic particles, but the ball represents a **virtual photon**.
 - The ball is throwing a ball to not other than that, to attract again, the people represent charged particles and the ball represents a "virtual photon".

Before, the strong nuclear force holds the neutrons and protons in a nucleus together, but it is not a **vector** to change into a particle in \vec{p} change or a particle to change into a neutron in \vec{p} change.
 - It is a **vector** to change into a particle in \vec{p} change or a particle to change into a neutron in \vec{p} change.
 - But the force is not the thing that changes particles.
 - The strong force is also not the cause for beta decay as it involves particles other than the electron and neutrino.
 - The weak force is a different force of work using these particles change to beta decay.

Capacitance

Capacitor is a device designed to store charge.
 - parallel metal plates placed near each other form a capacitor.
 - the plates have an equal and opposite charge.
 - the electric field is uniform and the electric potential of the battery is one of the plates.
 - the electric field does work on the other capacitor plate charge.

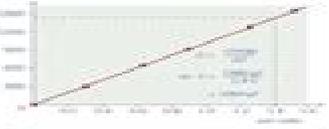

Capacitance C of a capacitor is defined as the charge stored per volt of potential difference.

$$C = \frac{Q}{V}$$

 - Q is the charge stored on the capacitor.
 - V is the potential difference across the capacitor.
 - C is proportional to the A/d .

Energy for movement of charge with time for a current.
 - the energy stored in the capacitor.
 - In Physics we measure electric energy as potential energy stored with $Q \times V$.

Energy stored in a capacitor:

$$W = \frac{1}{2} QV = \frac{1}{2} CV^2 = \frac{1}{2} \frac{Q^2}{C}$$

Energy stored in a capacitor:

$$W = \frac{1}{2} QV = \frac{1}{2} CV^2 = \frac{1}{2} \frac{Q^2}{C}$$

In the charging process, the battery transfers QV to the capacitor.
 - 50% of energy stored by battery QV is stored in capacitor.
 - The other 50% is needed for the **resistive losses**.

Superposition

- Superposition occurs when 2 or more waves pass through each other.
 - At the point where the waves meet, they combine to an extent before they move apart.
 - The principle of superposition states that, for waves meet, the total displacement of point is equal to the sum of individual displacements at that point.

Constructive Interference
 - when a crest meets a crest, a **supercrest** is created - the waves **reinforce** each other.
 - when a trough meets a trough, a **supertrough** is created - the waves **reinforce** each other.

Destructive Interference
 - when a crest meets a trough of the **same amplitude**, the resultant displacement is zero as the waves travel back and forth. This is called **total destructive interference**.
 - If they are not the same amplitude, the resultant displacement is called a **minicrest**.

Examples of Superposition

1. Standing waves on a rope
 - Standing waves are formed on a rope if two people send waves continuously along a rope from either end.
 - The two ends of progressive waves combine to form nodes along the rope.
 - At each node, the two ends of waves are 180° out of phase, so they cancel each other out.

2. Water waves in a ripple tank
 - A reflecting dipper on a water surface sends out circular waves.
 - Points of **destructive** interference are created when 2 waves meet in trough.
 - These points create gaps in the wavefronts.
 - Points of **constructive** interference are created when a crest meets a crest.

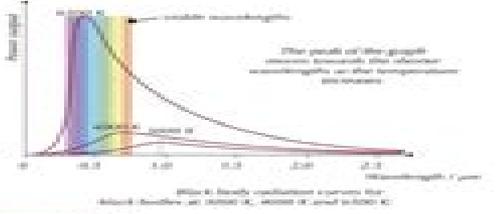

The Discovery of Photoelectricity

1887 - The ultraviolet spectrum and photoelectric radiation.
 1888 - Planck's interpretation in terms of quanta.
 1905 - The theory of quantum energy being in quanta distributed in photoelectricity.
 1916 - Einstein's explanation of photoelectricity and the significance in terms of the nature of the electron.

The Ultraviolet Spectrum

- It is light that is between the visible and the infrared.
 - A black body is a body that absorbs all the radiation of all wavelengths and re-emits all wavelength of the radiation.
 - Black body radiation is the emission spectrum of the radiation emitted by a black body.

Wien's Displacement Law and Stefan-Boltzmann Law

$$f = \sqrt{\frac{5}{3} R T} \quad \lambda_m = \frac{2.898 \times 10^{-3}}{T}$$

$$P = \sigma A \left(\frac{T}{T_0} \right)^4$$

$$P \propto \frac{1}{\lambda^4}$$

Classical Wave Theory

Why does the classical wave theory of light fail to explain photoelectric phenomena?

- Classical wave theory suggested that $P \propto \frac{1}{\lambda^4}$ but your experiment showed that the current is zero in the ultraviolet region.

Planck's Interpretation of Light

- Max Planck suggested that the energy can only be released in discrete packets, or quanta - the Planck law.
 - Einstein believed the energy could be discrete packets, photons, but photons have $E=hf$, quanta-the interaction with an electron in a metal surface.

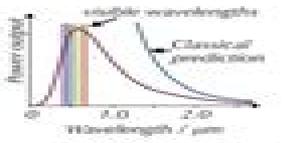

Figure 5: The classical wave theory prediction (blue line) tends to infinity in the ultraviolet region because it assumed that power is $\frac{1}{\lambda^4}$.
