commonly found in the groundwater abstracted from confined and unconfined aquifers The presence of iron and manganese in water is one of the most frequent reasons for customers complaint due to aesthetic issues yellow brown and black or stains on laundry and plumbing fixtures These two metals can be removed fairly readily by physico chemical treatment The municipal treatment systems deployed derive benefit from their larger scale particularly in relation to control but the processes used are less suitable for the numerous small supplies that are the most common water supplies throughout Europe especially in rural areas One important source of iron in drinking water is from old corroded cast iron water mains historically the material used most commonly in supply networks Replacement and refurbishment is very expensive and the major challenge is how best to prioritize available expenditure The purpose for this Best Practice Guide on the Control of Iron and Manganese in Water Supply is to give readers the broad view of a problem based on state of the art compilation of the range of scientific engineering regulatory and operational issues concerned with the control of iron and manganese in drinking water The Guide is of interest to water utility practitioners health agencies and policy makers as well as students on civil engineering and environmental engineering courses Authors Dr Adam Postawa AGH University of Science and Technology Faculty of Geology Geophysics and Environment Protection Krakow Poland and Dr Colin R Hayes University of Swansea UK Chair of IWA Specialist Group on Metals and Related Substances in Drinking Water
