**Analysis and Synthesis of Active RC Networks Containing Distributed and Lumped Elements** Stanford University. Stanford Electronics Laboratories, William J. Kerwin, 1967 Active RC networks realizing complex poles and  $j\omega$  axis zeros have previously required a large number of passive elements and relatively complex active structures The inclusion of distributed RC lines with lumped RC elements is shown to significantly reduce the number of passive elements and the complexity of the active elements used An analysis procedure is developed for the analysis of arbitrarily complex combinations of distributed lumped and active elements A model of the RC distributed line is chosen for computer analysis and is shown to give good agreement with experimental data In order to make the synthesis procedure a simple and practical one the transfer function to be realized is factored into a product of first and second order factors to be realized individually The active element utilized is an ideal voltage amplifier for simplicity and so that simple cascade connection of the networks realizing the separate factors will produce the complete transfer function The synthesis of the individual factors is reduced to choosing the appropriate one needed from a set of 4 networks which together realize all of the pole zero combinations required and determining the component values necessary to realize any one of the quadratic factors needed from a set of design charts Any necessary first order factors are then added in cascade using passive lumped RC networks A specific 5 pole 4 zero elliptic function low pass filter is synthesized by this method The complete filter uses 2 uniform RC lines 3 resistors 3 capacitors and 2 voltage amplifiers as compared to 7 resistors 9 capacitors and 2 voltage amplifiers in a lumped active RC realization
