Compressor Inboard Axial:

Marked peaks are the Gas Pulsation Related Frequency (4x RPM) and its harmonics. The levels are within the satisfactory range, however looking at the time waveform G-Swing and Crest Factor there looks to be some impacting going on (though asymmetrical across the x-axis). The correlated waveform seems to show that indeed there is regular impacting taking place (next page).

Sound and Vibrations of Positive Displacement Compressors Werner Soedel, 2006-10-20 Based on more than 30 years of research and practical experience this book is the first to combine theory and design guidelines dedicated solely to positive displacement compressors After introducing the sound and vibration producing mechanisms common to different types of compressors the author discusses free and forced vibrations of compressor housing shells mainly for hermetically sealed compressors He then examines vibration in casings and other components such as suction and discharge tubes and surging in coil springs Detailed chapters explore the design and vibrations of automatic plate or reed valves as well as the analysis and design of suction and discharge mufflers

A Theoretical

Study of Rotor Forces and Torques in Helical Twin Screw Compressors

Cheng Xiang You, 1994

Helical twin screw compressors are being increasingly used in the oil and gas process industry and for refrigeration and air conditioning duties This machine is capable of high reliability To achieve it both thermodynamic efficiency and rotor forces must be taken into consideration at the design stage In this study a computer program for analysing the forces in a twin screw compressor has been developed It takes into account all significant factors and includes a rotor profile generation program and a geometrical characteristics calculation program The programs developed have been integrated with an existing performance simulation program and used to investigate several design aspects of a refrigeration twin screw compressor and an unusual refrigeration system design A comprehensive examination of lobe tip designs suggests that lobe tip design parameters must be optimised if minimum power consumption is to be achieved and the use of a sealing strip gives an advantage A parameter study for optimum rotor geometrical parameter combinations has shown that the 4 5 and 5 6 combinations have in general high efficiencies but less rigidity while the 5 7 and 4 6 combinations give the opposite results The highest wrap angle and length diameter ratio do not always lead to the highest compressor performance A comprehensive examination of the influence of the slide valve on compressor performance and bearing forces has been conducted Procedures for determining the optimum slide stop and volume ratios are presented The detrimental effect of the non return valve in a refrigeration system driven by a twin screw compressor has been examined A non reversing clutch fitted to the prime mover is an alternative but must be designed according to the shut down torque which is higher than the normal running torque This is demonstrated An analytical model for axial torsional coupled vibration in an Oil injected twin screw compressor has been created A frequency analysis of all the excitations has been conducted by using an FFT technique It is found that the fundamental harmonic dominates the gas torque while the first two harmonics dominate the axial forces
