Fields, Frank V. Olinger, Richard C. Monaghan,1972 Radiant heating experiments were performed in the laboratory on an instrumented multispar wing structure to investigate 1 how accurately the structural temperatures of a Mach 3 cruise flight profile could be simulated 2 what the effects of the heating and heating inaccuracies would be on the responses of strain gage bridges installed on the structure and 3 how these responses would affect flight loads measurements Test temperatures throughout the structure agreed well with temperatures calculated for a Mach 3 profile In addition temperatures produced by two identical tests were repeatable to less than 6 K 0 10 F 0 Thermally induced strain gage bridge responses were large enough to be detrimental to a high speed flight loads program with a goal of establishing aerodynamic loads exclusive of thermal loads It was shown that heating simulation can be used effectively for thermal calibration that is to provide corrections for a high temperature environment and that thermal calibration may not be needed if the simulation data are used to carefully select bridges and load equations P i **Performance Potential of an Advanced Technology Mach 3 Turbojet Engine Installed on a Conceptual High-speed Civil Transport** Shelby J.
