Efficient Machine Learning Software Stack from Algorithms to Compilation Zixuan Jiang,2023 Machine learning enables the extraction of knowledge from data and decision making without explicit programming achieving great success and revolutionizing many fields These successes can be attributed to the continuous advancements in machine learning software and hardware which have expanded the boundaries and facilitated breakthroughs in diverse applications The machine learning software stack is a comprehensive collection of components used to solve problems with machine learning

algorithms It encompasses problem definitions data processing model and method designs software frameworks libraries code optimization and system management This stack supports the entire life cycle of a machine learning project The software stack allows the community to stand on the shoulders of previous great work and push the limit of machine learning fostering innovation and enabling broader adoption of machine learning techniques in academia and industry The software stack is usually divided into algorithm and compilation with distinct design principles Algorithm design prioritizes task related performance while compilation focuses on execution time and resource consumption on hardware devices Maintaining arithmetic equivalence is optional in algorithm design but compulsory in compilation to ensure consistent results The compilation is closer to hardware than algorithm design Compilation engineers optimize for hardware specifications while algorithm developers usually do not prioritize hardware friendliness Opportunities to enhance hardware efficiency exist in algorithm and compilation designs as well as their interplay Despite extensive innovations and improvements efficiency in the machine learning software stack is a continuing challenge Algorithm design proposes efficient model architectures and learning algorithms while compilation design optimizes computation graphs and simplifies operations However there is still a gap between the demand for efficiency and the current solutions driven by rapidly growing workloads limited resources in specific machine learning applications and the need for cross layer design Addressing these challenges requires interdisciplinary research and collaboration Improving efficiency in the machine learning software stack will optimize performance and enhance the accessibility and applicability of machine learning technologies In this dissertation we focus on addressing these efficiency challenges from the perspectives of machine learning algorithms and compilation We introduce three novel improvements that enhance the efficiency of mainstream machine learning algorithms Firstly effective gradient matching for dataset condensation generates a small insightful dataset accelerating training and other related tasks Additionally NormSoftmax proposes to append a normalization layer to achieve fast and stable training in Transformers and classification models Lastly mixed precision hardware aware neural architecture search combines mixed precision quantization neural architecture search and hardware energy efficiency resulting in significantly more efficient neural networks than using a single method However algorithmic efficiency alone is insufficient to fully exploit the potential in the machine learning software stack We delve into and optimize the compilation processes with three techniques Firstly we simplify the layer normalization in the influential Transformers obtaining two equivalent and efficient Transformer variants with alternative normalization types Our proposed variants enable efficient training and inference of popular models like GPT and ViT Secondly we formulate and solve the scheduling problem for reversible neural architectures finding the optimal training schedule that fully leverages the computation and memory resources on hardware accelerators Lastly optimizer fusion allows users to accelerate the training process in the eager execution mode of machine learning frameworks It leverages the better locality on hardware and parallelism in the computation graphs Throughout the dissertation we

emphasize the integration of efficient algorithms and compilation into a cohesive machine learning software stack We also consider hardware properties to provide hardware friendly software designs We demonstrate the effectiveness of the proposed methods in algorithm and compilation through extensive experiments Our approaches effectively reduce the time and energy required for both training and inference Ultimately our methods have the potential to empower machine learning practitioners and researchers to build more efficient powerful robust scalable and accessible machine learning solutions
