

## NUCLEAR CHEMISTRY AND APPLICATIONS OF RADIOACTIVITY

**Nuclear chemistry:** The branch of chemistry which deals with the study of radioactivity, nuclear processes and transformations in the nuclei of atoms etc. is called nuclear chemistry.

**Radioactivity:** The phenomenon of spontaneous emission of invisible radiations like  $\alpha$ -particles,  $\beta$ -particles and  $\gamma$ -particles from unstable nuclei to get the stability is called radioactivity.

The substances which show radioactivity are called radioactive substances. For example: Uranium, thorium, polonium etc.

### Units of radioactivity:

The unit of radioactivity is Curie (Ci) and defined as the mass of radioactive substance that can produce  $3.7 \times 10^{10}$  dis-integration per second. Its other units are milli curie and micro curie.

$$1 \text{ Ci} = 3.7 \times 10^{10} \text{ dps} = 3.7 \times 10^{10} \text{ Bq}$$

Note: Bq (Becquerel) is another unit of radioactivity.

**Natural radioactivity:** The process of self disintegration of unstable nuclei by emission of different types of radiations to get stability is called natural radioactivity. For example: Uranium, polonium and radium show natural radioactivity. Generally, heavier nuclei show natural radioactivity due to less binding energy per nucleon.

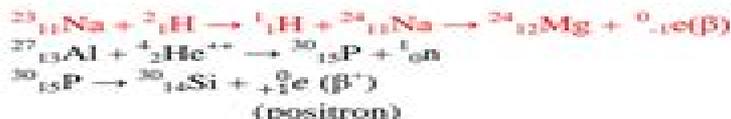

(Parent element) (Daughter nuclei) ( $\alpha$ -particle)

It cannot be controlled.

**Artificial radioactivity (Transmutation):** The process by which an element gets converted into new element by bombarding it with high energy particles is called artificial radioactivity.

It can be controlled by controlling the speed of bombarding particles.

For example:

**Nuclear reactions:** The reaction in which the compositions of certain nuclei undergo a change are called nuclear reactions.

There are two types of nuclear reactions and they are:

1. Nuclear fission reaction
2. Nuclear fusion reaction

**Nuclear fission reaction:** The nuclear reaction in which a heavy nucleus splits into two or more lighter nuclei with the simultaneous emission of large amount of energy is called nuclear fission reaction.

A chain reaction is set up in nuclear fission reaction. The products of the reaction are radioactive. For example:

**Nuclear fusion reaction:** The nuclear reaction in which two lighter nuclei combine with each other to give stable nuclei with higher mass is called nuclear fusion.

They are generally carried out at very high temperature. A chain reaction is not set up in the nuclear reaction. The products of the reaction are not radioactive. For example:

The total energy produced during formation of one nuclei of helium is 26.82MeV.

**Note:** A practical application of nuclear fusion reaction is the production of hydrogen bomb, which is the misuse of nuclear power. Hydrogen bomb is 1000 times powerful than the atomic bomb.

**Differences between nuclear fission and nuclear fusion reactions:** The differences between nuclear fission and nuclear fusion reactions:

Nuclear fission reaction	Nuclear fusion reaction
The nuclear reaction in	The nuclear reaction in

Kennedy, 1949 Introduction to Radiochemistry BY Gerhart Friedlander PREFACE An increasing number of universities are offering courses in radioactivity for chemists Very likely many teachers and students in these courses feel as we do that there has been no suitable textbook for this purpose There is the very excellent Manual of Radioactivity by G Hevesy and F A Paneth however advances in the science since its last edition in 1938 have been more than any authors should have to expect in one decade Moreover no recent book on the subject has been written specifically for chemists We have tried to prepare a textbook for an introductory course in the broad field of radiochemistry at the graduate or senior undergraduate level taking into account the degree of previous preparation in physics ordinarily possessed by chemistry students at that level We would like to offer definitions of terms including radio chemistry nuclear chemistry tracer chemistry and radiation chemistry that are heard increasingly today Unfortunately the meanings of some of these vary from laboratory to laboratory and they are hardly used concisely at all By one group nuclear chemistry is used to mean all applications of chemistry and nuclear physics to each other including stable isotope applications However to our minds nuclear chemistry emphasizes the reactions of nuclei and the properties of resulting nuclear species just as organic chemistry is concerned with reactions and properties of organic compounds We think of tracer chemistry as the field of chemical studies made with the use of isotopic tracers including studies of the essentially pure tracers at extremely low concentrations In the title of this book we have meant the term radio chemistry to include all the fields just described but to exclude stable isotope tracer applications Radiation

chemistry which is not discussed in this text deals with the chemical effects produced by nuclear and other like radiations and although it involves some of the phenomena of radiochemistry it is really closely related to photochemistry Some comments on the order in which the subject matter is presented are perhaps appropriate We believe that the sequence of chapters after chapter VI is the logical one the order of presentation of the material of the first five chapters is much more nearly a matter of individual choice Our plan which we have found quite teachable is to use the historical background as a brief introduction to the concepts and terminology this makes the going much easier in the succeeding topics Chapter V actually follows logically after chapter I and nothing in the arrangement of the material prevents its introduction there if preferred but we feel that it is more effective first to present further descriptive information about atomic nuclei and nuclear reactions than to confront the student at this point with the quantitative treatment of growth and decay processes The development of the subject matter in this book has grown out of an introductory course in radiochemistry first given in the informal Los Alamos University in the latter part of 1945 by the authors principally G F with the help of Drs R W Dodson and A C Wahl and offered each year since in the Department of Chemistry at Washington University St Louis by one of us J W K
