

Particle Interactions:

What does a single force tell us as an object, it changes the momentum (velocity/energy) of an object.
Force = velocity
 and how many two objects they exert equal and opposite forces on each other.
 - transferred between the objects by their forces, if an other force act on them.

Force in Fundamental Interactions

and Atoms all nuclei - strong attractive
 binds the nucleus together. Also known as strong nuclear force (strong interaction, strong force)
 responsible for the radioactive decay of nucleus (slowly)
 Gravity: A type of physical interaction between elementary charged particles (Attracted/repulsion)

Why are magnetic force (attraction and repulsion) forces?
 Physics suggested that electromagnetic force were due to the exchange of **virtual photons**.

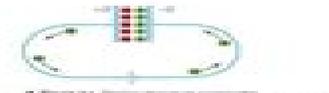

The closest thing a ball to not other means than to equal, as the ball transfer momentum from the one another, the people represent macroscopic particles and the ball represents the **exchange particles**.
 The ball's throwing a ball to not other than that, to attract again, the people represent charged particles and the ball's represent the "exchange particles".

Before, the strong nuclear force holds the neutrons and protons in a nucleus together, but it is not a **force to change into a particle in P theory** or a **particle to change into a neutron in P theory**.
 It's combined result of the macroscopic force or neutron is unchanged.
 but the force is not so they don't change particles.
 The nuclear force is also not the cause for beta decay as it involves particles other than the neutron and proton.
 The result is a different form of work using these particles change to beta particles.

Capacitance

Capacitor is a device designed to store charge.
 parallel metal plates placed near each other form a capacitor.
 the plates can be equal and opposite charge.
 the more charge the battery put on each plate the more positive terminal of the battery use out of the plates.
 the more of electrons from the other plate to come to its surface to be **positive terminal**.
 the more more charge it is and the other capacitor store charge.

capacitance of a capacitor is defined as the charge stored per volt of potential difference.
 $C = \frac{Q}{V}$

Energy to separate all charges up to the V potential is the energy stored in the capacitor.
 In Physics we measure electric energy as potential that a charge with 1C has.
 potential V is proportional to the Q .
 and in a charged capacitor
 energy stored is a capacitor.
 the more the field across it, the higher the value of the other plate energy to come to the region of **electric potential energy**.

$E = \frac{1}{2} QV = \frac{1}{2} CV^2 = \frac{1}{2} \frac{Q^2}{C}$

In the charging process, the battery transfer **ENERGY** to the circuit.
 - 50% of energy stored by battery (50% is stored in capacitor).
 - the other 50% is transfer to the **resistor in circuit**.

Superposition

- Superposition occurs when 2 or more waves pass through each other.
 - At the point where the waves meet, they combine to an extent before they move apart.
 - The principle of superposition states that, for waves meet, the total displacement of point is equal to the sum of individual displacements at that point.

Constructive Interference
 - when a crest meets a crest, a **supercrest** is created - the waves **reinforce** each other.
 - when a trough meets a trough, a **supertrough** is created - the waves **reinforce** each other.

Destructive Interference
 - when a crest meets a trough of the **same amplitude**, the resultant displacement is zero as the waves travel back and forth. This is called **total destructive interference**.
 - If they are not the same amplitude, the resultant displacement is called a **minimax**.

Examples of Superposition

1. Standing waves on a rope
 - Standing waves are formed on a rope if two people send waves continuously along a rope from either end.
 - The two ends of progressive waves combine to form waves along the rope.
 - At each node, the two ends of waves are **180° out of phase**, so they cancel each other out.

2. Water waves in a ripple tank
 - A reflecting dipper on a water surface sends out circular waves.
 - Points of **constructive** and **destructive** interference when 2 waves meet in a trough.
 - These points create gaps in the wavefronts.
 - Points of **destructive** are marked when a crest meets a crest.

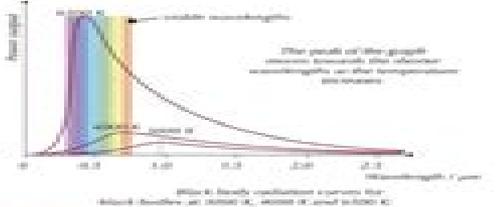

The Discovery of Photoelectricity

1. The classical wave theory and photoelectric effect.
 2. Planck's interpretation in terms of quanta.
 3. The theory of quantum wave being in better agreement with photoelectricity.
 4. Einstein's explanation of photoelectricity and its significance in terms of the nature of the electron.

The Classical Approach

- If light had no limit the electrons can emit the electron due to **continuous**.
 - A metal body is a body that does not of the emission of its wavelength and its rate of **emission of its radiation**.
 - Photo body relation is the maximum spectrum of the radiation emitted by a black body.

Wien's Displacement and Stefan's Law

$$P = \sigma A T^4$$

$$P = 5.67 \times 10^{-8} \times A \times T^4$$

$$P \propto \frac{1}{\lambda^5}$$

Classical wave theory
 The peak of the graph moves towards the shorter wavelengths as the temperature increases.
 Wien's displacement law states that the wavelength of the maximum intensity is inversely proportional to the temperature.
 $\lambda_m T = b$
 where $b = 2.898 \times 10^{-3} \text{ m} \cdot \text{K}$

Planck's Interpretation of light

- Max Planck suggested that the energy can only be released in discrete packets, or quanta - the **Photo law**.
 - Discrete instead of the waves emit in discrete packets, photon, but photon has $E=h\nu$, quanta-the interaction with an electron in a metal surface.

Figure 2: The classical wave theory prediction (blue line) tends to infinity in the ultraviolet region because it assumed that power is $\frac{1}{\lambda^5}$.
