

## 7.3 Genetic engineering

At the end of the section, students are expected to

- explain how information in the DNA allows the transfer of information and synthesis of proteins;
- describe the process of genetic engineering;
- conduct a survey of current uses of genetically modified organisms;
- evaluate the benefits and risk of GMOs

### GENES, DNA AND CHROMOSOMES

A gene is a distinct part of a cell's deoxyribonucleic acid (DNA) which contains the coded instructions about how to produce what our bodies need. This coded information is contained in the cell's DNA, which is a molecule made from four nucleotides: adenine (A), cytosine (C), guanine (G), and thymine (T). They are remembered as A, C, G, and T. A strand of DNA is composed of a sequence of these four nucleotides. The DNA is contained in a cell called the chromosome. The chromosome is found in the cell's nucleus.

#### DNA replication

In each cell, DNA duplicates itself so that when the cell divides, either through mitosis or meiosis, each daughter cell receives the correct number of chromosomes. The process of DNA duplication is called *DNA replication*.

**Table 7.9 Steps in DNA replication**

a. Separation	Two strands of the DNA double helix unwind and separate from each other
b. Base pairing	Unpaired bases form new hydrogen bonds with free nucleotides (A-C-T-G)
c. Joining	Newly paired bases create a new strand which is complementary to the parent strand, forming two new double helices that are identical with the original DNA double helix.
