Human mesenchymal stromal cells MSCs can be harvested from many tissues including bone marrow BM cord blood CB adipose tissue umbilical cord UC placenta and others In recent years there has been an overwhelming interest in MSC as reflected in the number of reports regarding their characterization biological properties and clinical application One of the specific areas of research involves the characterization of MSCs derived from different sources as well as the potential differences between them More recently reports have been published on derivatives from MSCs such as extracellular vesicles EVs exosomes and mitochondria but their characterization mechanisms of action in immunomodulatory functions and regeneration aspects have not been fully elucidated

Sex Bias in Autoimmunity: From Animal Models to Clinical Research and Applications Coziana Ciurtin, Veena Taneja, Elizabeth C Jury, 2023-01-17

Autoimmune diseases are characterized by an abnormal and self directed immune response leading to damage and dysfunction of multiple organs and tissues Most autoimmune diseases are recognized as affecting disproportionately more women than men suggesting a crucial role of sex hormones in modulating immune responses with estrogens being postulated as enhancing autoimmunity and androgens playing a protective role It is also widely acknowledged that there is an overwhelming male bias in non human animal studies of autoimmune diseases while studies of both sexes in human research frequently fail to analyze results by sex Underrepresentation of females in animal models of autoimmune disease is often justified by their intrinsic variability during the reproductive period compromising the understanding of impact of the female sex chromosome and hormones on immune system functions leading to the high prevalence of autoimmune conditions This Research Topic will highlight the most recent advances in understanding the possible mechanisms for sex specific differences in autoimmunity with a specific focus on pre clinical animal and human models of autoimmune inflammation as well as on the most common sex specific differences in autoimmune diseases The topic will emphasize advances in research exploring sex determinants in autoimmune rheumatic diseases such as systemic lupus erythematosus rheumatoid arthritis spondyloarthritis psoriatic arthritis Sj gren s syndrome and further diseases such as inflammatory bowel disease autoimmune hepatitis multiple sclerosis psoriasis asthma and more The present Research Topic will include both full length and short research communications as well as perspective and review articles addressing various aspects of sex biased differences in pathogenesis age at disease onset clinical manifestations disease course treatment response associated co morbidities and overall survival across different autoimmune diseases

Rachana Singh, Krithika Lingappan, Hudson Santos, 2025-12-08 While the majority of newborns are born healthy at term gestational age with the advancement of medical surgical interventions in neonatal care many newborns have complex disorders at birth with the potential for long term neuro developmental deficits These are seen in the increased survival of pre term infants with associated complications of pre term birth as well as term infants with congenital medical and surgical disorders There is some growing evidence that variations in neonatal outcomes cannot be solely explained by the illness severity and clinical interventions There are additional factors in play that can potentially have a negative impact and identifying some modifiable risk factors could help in mitigating the inequities in outcomes Also knowing well that race is a social construct it is very commonly reported in ongoing studies and can lead to biases in care provision Currently there is a limited body of literature highlighting the influences of neonatal sex race ism and maternal Social Determinants of Health SDoH on neonatal outcomes It is a common adage in pediatrics that male infants will have a relatively poor outcome compared to female infants but the why is still unanswered Historically race has been tied in with health outcomes sending an erroneous message with a huge impact on care provision to people of color and minorities Lastly disparities in accessing healthcare based on one s socioeconomic status and the neighborhood one lives in are documented for adults and children We would like to identify the scientific rationale about the role infant sex plays how we can eliminate race ism as influencing outcomes and how we can effectively address SDoH related modifiable factors by early identification and creating public health policies to support the families and newborns affected by it We would like to invite original research as well as review articles focusing on these 3 factors sex race ism as well as SDoH These could be either focus on the existing evidence or well thought out pieces on how to best identify address both the modifiable SDoH as well as non modifiable sex race ism factors in the context of outcomes for infants at high risk Advocacy pieces as well as possible public health policy pieces would be also welcomed The Journal of Immunology ,2009 **Novel Insights into Inflammatory Roles of Mast Cells and Basophils** Satoshi Tanaka, Frans J. first proposed that macrophages and mast cells could be a relevant source of angiogenic factors. Since then much effort has gone into the elucidation of the role of immune cells in the modulation of angiogenesis and lymphangiogenesis. There is now compelling evidence that several components of the innate and adaptive immune system are implicated in inflammatory and neoplastic angiogenesis and lymphangiogenesis. Articles in this volume deal with the emerging intriguing possibility that immune cells are both a source and a target of angiogenic and lymphangiogenic factors. Therefore cells of the immune system might play a role in inflammatory and neoplastic angiogenesis/lymphangiogenesis through the expression of several angiogenic factors and their receptors and co-receptors. The important new findings in this volume will be of special interest to vascular biologists, basic and clinical immunologists, oncologists and to specialists in allergic and immune disorders.

The Innate Immune Response to Noninfectious Stressors Massimo Amadori, 2016-02-23. This book highlights fundamental mechanisms of stress response and important findings on how the immune system is affected and in turn affects such a response. In addition, this book covers the crucial link between stress response and energy metabolism, prompts a re-appraisal of some crucial issues and helps to define research priorities in this fascinating, somehow elusive field of investigation. Provides insights into the fundamental homeostatic processes vis-à-vis stressors to help in investigation. Illustrates the depicted tenets and how to offset them against established models of response to physical and psychosocial stressors in both animals and humans. Covers the crucial issue of the immune response to endocrine disruptors. Includes immunological parameters as a reporter system of environmental adaptation. Provides many illustrative examples to foster reader understanding.

Inflammation and Angiogenesis Domenico Ribatti, 2017-11-08. This book is focused on the analysis of the role played by immune cell components in the angiogenic process associated with inflammation and tumor growth. Both innate and adaptive immune cells are involved in the mechanisms of endothelial cell proliferation, migration and activation through the production and release of a large spectrum of pro-angiogenic mediators. These may create the specific microenvironment that favors an increased rate of tissue vascularization. The link between chronic inflammation and tumorigenesis was first proposed by Rudolf Virchow in 1863 after the observation that infiltrating leukocytes are a hallmark of tumors and first established a causative connection between the lymphoreticular infiltrate at sites of chronic inflammation and the development of cancer. Tumors were described as wounds that never heal and surgeons have long described the tendency of tumors to recur in healing resection margin and it has been reported that wound healing environment provides an opportunistic matrix for tumor growth. As angiogenesis is the result of a net balance between the activities exerted by positive and negative regulators, this book will also provide information on some anti-angiogenic properties of immune cells that may be utilized for a potential pharmacological use as anti-angiogenic agents in inflammation as well as in cancer. The work is written for researchers in the field and also for graduate students who approach this matter.

Koprowski,2013-03-09 All multicellular organisms may possess innate immunity mediated by defense mechanisms with which the organism is born In recent years much has been learned about the diversity of innate immune mechanisms A large array of naturally produced antimicrobial peptides has been de fined A variety of cell surface receptors that recognize common patterns displayed by infectious organisms have been identified along with the intracellular pathways that these receptors use to activate cellular defense functions Cell surface receptors on natural killer NK cells have been shown to sense microbial invasion in neighboring cells thereby setting into motion their elimination by cy totoxic mechanisms Other receptors have been found to facilitate phagocytosis and intracellular killing of microbes by phagocytic cells These and other natural defense mechanisms have traditionally been viewed as the first line of body defense in vertebrate species that also possess the capacity for acquired or adaptive immunity Sharks and all of the other jawed vertebrates generate large repertoires of T and B lymphocyte clones that display different antigen specific receptors in the form ofT cell receptors TCR and immunoglobulins Ig that allow them to recognize and respond to antigens in collaboration with antigen present ing cells Memory T and B cells are then generated to allow faster and heightened cellular and humoral immune re sponses on secondary antigen encounter In recent years it has also become obvious that innate immune responses can directly influence adaptive immune responses in ways that will enhance body defense **Crossroads Between Innate and Adaptive Immunity IV** Peter D. Katsikis,Stephen P. Schoenberger,Bali Pulendran,2016-08-23 This volume presents a collection of reviews derived from work presented at the Aegean Conference 4th Crossroads between innate and adaptive immunity This meeting was the fourth in a series and assembled a team of scientists working on mechanisms by which the innate immune system of the host senses pathogens the cellular and signaling networks that orchestrate the innate response and antigen presentation and adaptive immunity The importance of the crosstalk between innate immunity and the adaptive immune response has only recently started to be appreciated Although it is well recognized that dendritic cells NK cells NK T cells and T cells are all critical for the host response to pathogens the respective fields that study the biology of these immune cells tend to exist in parallel worlds with minimum exchange of information and ideas This fragmentation hinders the integration of these fields towards a

unified theory of host response The Aegean Conference Crossroads between Innate and Adaptive Immunity brought together leading international scientists and experts to address critical areas of Innate and Adaptive immunity something necessary for the development of more efficient scientific exchange and crosspollination between these fields This conference attracted scientists from all over the world to discuss their latest findings on the various aspects of Innate and Adaptive immunity The conference had limited participation and a scientific and social program that maximized scientific interchange through lecture presentations poster sessions and informal discussions

III Bali Pulendran, Peter D. Katsikis, Stephen P. Schoenberger, 2011-08-19 This volume presents a collection of reviews derived from work presented at the Aegean Conference 3rd Crossroads between innate and adaptive immunity which occurred during September 27 October 2 2009 at the Minoa Palace Conference Center in Chania Crete Greece This meeting was the third in a series and assembled a team of scientists working on mechanisms by which the innate immune system of the host senses pathogens the cellular and signaling networks that orchestrate the innate response and antigen presentation and adaptive immunity The various facets of the innate response including dendritic cells T cells B cells NK cells NK T cells and the complement cascade during the host response to pathogens and tumors is only now starting to be elucidated The respective fields that focus on these immune cells and molecules have tended to be relatively compartmentalized and yet emerging evidence points to the interconnectedness of these facets in coordinating the innate response and its subsequent impact on the adaptive response The goal of this conference was to initiate cross talk between these diverse immunological fields and promote and facilitate discussion on the interactions between the innate immune response and the adaptive immune response and ultimately facilitate collaboration between these areas of study Following on the footsteps of the outstanding success of its precursors the 3rd Crossroads between Innate and Adaptive Immunity Aegean Conference was highly successful in bringing together and connecting scientists and experts from around the world to address critical areas of Innate and Adaptive immunity
