**Orbital Mechanics for Engineering Students** Howard D. Curtis, 2020-08-31 *Orbital Mechanics for Engineering Students* Fourth Edition is a key text for students of aerospace engineering. While this latest edition has been updated with new content and included sample problems, it also retains its teach-by-example approach that emphasizes analytical procedures, computer-implemented algorithms, and the most comprehensive support package available, including fully worked solutions, PPT lecture slides, and animations of selected topics. Highly illustrated and fully supported with downloadable MATLAB algorithms for project and practical work, this book provides all the tools needed to fully understand the subject. Provides a new chapter on the circular restricted 3-body problem, including low energy trajectories. Presents the latest on interplanetary mission design, including non-Hohmann transfers and lunar missions. Includes new and revised examples and sample problems.

*Orbital Mechanics for Engineering Students* Howard D. Curtis, 2009-10-26 *Orbital Mechanics for Engineering Students* Second Edition provides an introduction to the basic concepts of space mechanics. These include vector kinematics in three dimensions, Newton's laws of motion and gravitation, relative motion, the vector-based solution of the classical two-body problem, derivation of Kepler's equations, orbits in three dimensions, preliminary orbit determination, and orbital maneuvers. The book also covers relative motion and the two-impulse rendezvous problem, interplanetary mission design using patched conics, rigid body dynamics used to characterize the attitude of a space vehicle, satellite attitude dynamics, and the characteristics and design of multi-stage launch vehicles. Each chapter begins with an outline of key concepts and concludes with problems that are based on the material covered. This text is written for undergraduates who are studying orbital mechanics for the first time and have completed courses in physics, dynamics, and mathematics, including differential equations and applied linear algebra. Graduate students, researchers, and experienced practitioners will also find useful review materials in the book.

**NEW** Reorganized and improved discussions of coordinate systems, new discussion on perturbations and quaternions. **NEW** Increased coverage of attitude dynamics, including new Matlab algorithms and examples in chapter 10. **NEW** examples and homework problems.
