**Understanding Non-equilibrium Thermodynamics** Georgy Lebon, David Jou, 2008-01-12 Our time is characterized by an explosion of information and by an acceleration of knowledge. A book cannot compete with the huge amount of data available on the Web. However, to assimilate all this information, it is necessary to structure our knowledge in a useful conceptual framework. The purpose of the present work is to provide such a structure for students and researchers interested by the current state of the art of non-equilibrium thermodynamics. The main features of the book are a concise and critical presentation of the basic ideas, illustrated by a series of examples selected not only for their pedagogical value but also for the perspectives offered by recent technological advances. This book is aimed at students and researchers in physics, chemistry, engineering, material sciences, and biology. We have been guided by two apparently antagonistic objectives: generality and simplicity. To make the book accessible to a large audience of non-specialists, we have decided about a simplified but rigorous presentation. Emphasis is put on the underlying physical background without sacrificing mathematical rigour; the several formalisms being illustrated by a list of examples and problems. Altogether, this work has been guided by the formula: Get more from the less, with the purpose to make a maximum of people aware of a maximum of knowledge from a minimum of basic tools. Besides being an introductory text, our objective is to present an overview as general as possible of the more recent developments in non-equilibrium thermodynamics, especially beyond the local equilibrium description.

*Non-equilibrium Thermodynamics Of Heterogeneous Systems (Second Edition)* Signe Kjelstrup, Dick Bedeaux, 2020-08-27 This book utilizes non-equilibrium thermodynamics to describe transport in complex heterogeneous media. There are large coupling effects between transport of heat, mass, charge, and chemical reactions at surfaces, and it is important to know how one should properly integrate across systems where different phases are in contact. There is no other book available today that gives a prescription of how to set up flux equations for transports across heterogeneous systems.

Differential Geometric Foundations of Non-Equilibrium Thermodynamics Marcus Hildebrandt, 2025-02-27 While all field theories are nowadays available in a modern differential geometric coordinate-free formulation on manifolds, this has been so far only rudimentarily accomplished in general non-equilibrium thermodynamics. In this work, it is shown how a fitting geometric structure can be derived for arbitrary compact discrete Schottky systems, thermodynamic systems such as stars and black holes, using only a few thermodynamic principles. This leads to deep geometric insights. Some central results are the following: while in the theory of relativity the energy-momentum tensor determines the geometry of the space, in non-equilibrium thermodynamics the 1-form of the entropy production rate is responsible for the emergence of a well-known geometric structure: the contact geometry. Relaxation processes remain in the fibers in which they start and end on an attractor manifold that can be identified with the classical equilibrium subspace of thermostatics. One then proves that outside this attractor manifold, there are no reversible process directions. As a

consequence of this the 2nd Law of thermodynamics lives mainly on the fibers of the state manifold the so called vertical geometric structure while the 1st Law of thermodynamics is formulated on the horizontal components of the state manifold The internal energy provides a physical gauge for each fiber The 1st and 2nd Law of thermodynamics are coupled via the representation of the entropy flux 1 form that can be represented in the dual basis of exchange 1 forms such as the heat 1 form This fact can be used to provide a coordinate free invariant definition of non equilibrium temperature Finally it is shown that probably the most general geometric structure to model non equilibrium thermodynamics of compact discrete Schottky systems systems is given by a composite fibred cocontact phase manifold that includes time as an explicit dimension

Nonequilibrium Statistical Physics Roberto Livi, Paolo Politi, 2017-10-05 Statistical mechanics has been proven to be successful at describing physical systems at thermodynamic equilibrium Since most natural phenomena occur in nonequilibrium conditions the present challenge is to find suitable physical approaches for such conditions this book provides a pedagogical pathway that explores various perspectives The use of clear language and explanatory figures and diagrams to describe models simulations and experimental findings makes the book a valuable resource for undergraduate and graduate students and also for lecturers organizing teaching at varying levels of experience in the field Written in three parts it covers basic and traditional concepts of nonequilibrium physics modern aspects concerning nonequilibrium phase transitions and application orientated topics from a modern perspective A broad range of topics is covered including Langevin equations Levy processes directed percolation kinetic roughening and pattern formation

**Exactly Solved Models: A Journey In Statistical Mechanics - Selected Papers With Commentaries (1963-2008)** Fa Yueh Wu, 2009-03-03 This unique volume provides a comprehensive overview of exactly solved models in statistical mechanics by looking at the scientific achievements of F Y Wu in this and related fields which span four decades of his career The book is organized into topics ranging from lattice models in condensed matter physics to graph theory in mathematics and includes the author s pioneering contributions Through insightful commentaries the author presents an overview of each of the topics and an insider s look at how crucial developments emerged With the inclusion of important pedagogical review articles by the author Exactly Solved Models is an indispensable learning tool for graduate students and an essential reference and source book for researchers in physics and mathematics as well as historians of science

**Non-equilibrium Energy Transformation Processes** Viktor Holubec, 2014-05-22 Various experimental techniques have been advanced in recent years to measure non equilibrium energy transformations on the microscopic scale of single molecules In general the systems studied in the corresponding experiments are exposed to strong thermal fluctuations and thus the relevant energetic variables such as work and heat become stochastic This thesis addresses challenging theoretical problems in this active field of current research 1 Exact analytical solutions of work and heat distributions for isothermal non equilibrium processes in suitable

Mechanics of Electromagnetic Solids G.A. Maugin, 1988-03 This volume is a rigorous cross disciplinary theoretical treatment of electromechanical and magnetomechanical interactions in elastic solids Using the modern style of continuum thermomechanics but without excessive formalism it starts from basic principles of mechanics and electromagnetism and goes on to unify these two fields in a common framework It treats linear and nonlinear static and dynamic problems in a variety of elastic solids such as piezoelectrics electricity conductors ferromagnets ferroelectrics ionic crystals and ceramics Chapters 1 3 are introductory describing the essential properties of electromagnetic solids the essentials of the thermomechanics of continua and the general equations that govern the electrodynamics of nonlinear continua in the nonrelativistic framework e g Maxwell s equations the fundamental balance laws of continuum mechanics basic thermodynamical inequalities for electromagnetic continua jump relations for studying the propagation of shock waves nonlinear constitutive equations for large classes of materials The remainder of the text presents in detail special cases applications solved problems and more complex schemes of electromagnetic matter Chapters 4 and 5 examine material schemes whose description relies on the above mentioned equations Chapters 6 and 7 are more advanced reporting on recent progress in the field Suitable for graduate teaching the volume will also be useful to research workers and engineers in the field of electromagnetomechanical interactions and to those interested in the basic principles mathematical developments and applications of electroelasticity and magnetoelasticity in a variety of solid materials such as crystals polycrystals compounds and alloys
