

Statistics - Negative Binomial Distribution

Negative binomial distribution is a probability distribution of number of occurrences of successes and failures in a sequence of independent trials before a specific number of success occurs. Following are the key points to be noted about a negative binomial experiment.

- The experiment should be of x repeated trials.
- Each trial have two possible outcome, one for success, another for failure.
- Probability of success is same on every trial.
- Output of one trial is independent of output of another trial.
- Experiment should be carried out until r successes are observed, where r is mentioned beforehand.

Negative binomial distribution probability can be computed using following:

Formula

$$f(x; r, P) = {}^{x-1}C_{r-1} \times P^r \times (1 - P)^{x-r}$$

Where:-

- x = Total number of trials.
- r = Number of occurrences of success.
- P = Probability of success on each occurrence.
- $1 - P$ = Probability of failure on each occurrence.
- $f(x; r, P)$ = Negative binomial probability, the probability that an entire negative binomial experiment results in the r success on the x th trial, when the probability of success on each trial is P .

Doctoral Thesis Dissertation from the year 1999 in the subject Geography Earth Science Cartography Geographic Information Science and Geodesy grade 1 0 University of Copenhagen Geophysical Department language English abstract The primary objectives of this thesis are 1 to find and theoretically discuss the relevant statistical distributions for backscatter coefficients intensities in SAR images 2 to develop and examine methods which can be applied for a statistical analysis of intensities in SAR images over homogeneous open sea areas an analysis which hopefully can be used to detect departures from homogeneity 3 to use these methods for an examination of the statistical behaviour of the intensities in SAR images Objective 2 is subdivided into two parts 2a development of parameter estimation methods for statistical distributions 2b examination of different types of statistical test methods It will be demonstrated that the three parameter generalized gamma distribution describes the statistical distribution of intensities in homogeneous sea areas as well as the K distribution and that the parameters in the generalized gamma distribution are easier and more robust to estimate than the parameters in the K

distribution Therefore the generalized gamma distribution is recommended to model a homogeneous sea surface for instance
it the target is to detect ships or icebergs in a SAR image *Technical note* ,1966 **Index to Statistics and Probability:
