What does it mean the bisection method

The bisection method in mathematics is a root-finding method that repeatedly bisects an interval and then selects a subinterval in which a root must lie for further processing. It is a very simple and robust method, but it is also relatively slow. Because of this, it is often used to obtain a rough approximation to a solution which is then used as a starting point for more rapidly converging methods. The method is also called the interval halving method, the binary search method, or the dichotomy method.]

The method

The method is applicable for numerically solving the equation $f(x) = 0$ for the real variable x , where f is a continuous function defined on an interval $[a, b]$ and where $f(a)$ and $f(b)$ have opposite signs.

In this case a and b are said to bracket a root since, by the intermediate value theorem, the continuous function f must have at least one root in the interval (a, b) .

As you see in this picture
 $f(x)$ continue in $[a, b]$
 $f(a)f(b) < 0$
so their is the equation
 $f(x) = 0$

"Make sure to prove that $f(x)$ is continue in $[a, b]$... if you want a single solution."
