

UNIT-1

NUMERICAL METHOD

We use numerical method to find approximate solution of problems by numerical calculations with aid of calculator. For better accuracy we have to minimize the error.

Error = Exact value – Approximate value

Absolute error = modulus of error

Relative error = Absolute error / (Exact value)

Percentage error = 100 X Relative error

The error obtained due to rounding or chopping is called rounding error.

For example $\pi = 3.14159$ is approximated as 3.141 for chopping (deleting all decimal)

or 3.142 for rounding up to 3 decimal places.

Significant digit:

It is defined as the digits to the left of the first non-zero digit to fix the position of decimal point.

For example each of following numbers has 5 significant digits.

0.00025610, 25.610, 25601, 25610

Solution of Equations by Iteration:

Intermediate value Theorem: If a function $f(x)$ is continuous in closed interval $[a,b]$ and satisfies $f(a)f(b) < 0$ then there exists atleast one real root of the equation $f(x) = 0$ in open interval (a,b) .

Algebraic equations are equations containing algebraic terms (different powers of x). For example $x^2-7x+6=0$

Transcendental equations are equations containing non-algebraic terms like trigonometric, exponential, logarithmic terms. For example $\sin x - e^x = 0$

A. Fixed point iteration method for solving equation $f(x) = 0$

Procedure

Step-I We rewrite the equation $f(x) = 0$ of the form $x = h(x)$, $x=g(x)$, $x = D(x)$

We find the interval $[a,b]$ containing the solution (called root).

Step-II We choose that form say $x = h(x)$ which satisfies $|h'(x)| < 1$ in interval (a,b) containing the solution (called root).

Step-III We take $x_{n+1} = h(x_n)$ as the successive formula to find approximate solution (root) of the equation $f(x) = 0$

Step-III Let $x=x_0$ be initial guess or initial approximation to the equation $f(x) = 0$

Introduction To Numerical Computation, An (Second Edition) Wen Shen, 2019-08-28
This book serves as a set of lecture notes for a senior undergraduate level course on the introduction to numerical computation which was developed through 4 semesters of teaching the course over 10 years. The book requires minimum background knowledge from the students including only a three semester of calculus and a bit on matrices. The book covers many of the introductory topics for a first course in numerical computation which fits in the short time frame of a semester course. Topics range from polynomial approximations and interpolation to numerical methods for ODEs and PDEs. Emphasis was made more on algorithm development, basic mathematical ideas behind the algorithms, and the implementation in Matlab. The book is supplemented by two sets of videos available through the author's YouTube channel. Homework problem sets are provided for each chapter and complete answer sets are available for instructors upon request. The second edition contains a set of selected advanced topics written in a self-contained manner suitable for self-learning or as additional material for an honored version of the course. Videos are also available for these added topics.
