Subsea Pipelines and Risers Yong Bai, Qiang Bai, 2005-12-05 Marine pipelines for the transportation of oil and gas have become a safe and reliable part of the expanding infrastructure put in place for the development of the valuable resources below the world's seas and oceans The design of these pipelines is a relatively new technology and continues to evolve as the design of more cost effective pipelines becomes a priority and applications move into deeper waters and more hostile environments This updated edition of a best selling title provides the reader with a scope and depth of detail related to the design of offshore pipelines and risers not seen before in a textbook format With over 25 years experience Professor Yong Bai has been able to assimilate the essence of the applied mechanics aspects of offshore pipeline system design in a form of value to students and designers alike It represents an excellent source of up to date practices and knowledge to help equip those who wish to be part of the exciting future of this industry

Division 1 nuclear power plant piping Buried pipe and its interface with buildings and equipment *Performance of Buried Pipe Installation* Michele Barbato, 2010 Existing codes and recommendations often require standard minimum values for the bedding backfill and fill cover geometric and mechanical properties in the installation of buried pipes under transportation facilities These recommended values are often obtained by considering the worst case scenario for each component and account only in an approximate way for the soil structure interaction SSI between bedding backfill fill cover and pipes of different materials and mechanical properties Performance in terms of reliability and cost effectiveness of the design is not fully addressed by current specifications The need arises for revising the current specifications to obtain a more efficient design of the installation of buried pipes Current design methodologies for buried pipes are still based on the Marston theory for estimating vertical loads This design method is based on the assumption of an elastic isotropic soil above and around the pipe Such an approach has been deemed as overconservative given the simplifications associated with these inherent assumptions In addition the method does not consider the effects of different bedding materials and thicknesses nor does it consider the effects of a very soft natural soil which is commonly encountered in Southern Louisiana The buried pipe installation considered in this project is a trench type with vertical walls shallow cover and a single pipe The live loads due to the vehicular traffic produce significant stresses on the pipe and the soil in the trench with a stress distribution strongly dependent on the specific geometric and mechanical properties of the entire soil pipe system Underground Pipes G.
