Concrete Sleepers Rail:

Concrete Railway sleepers FIB - International Federation for Structural Concrete,1987-01-01 The use of concrete sleepers in railways started in the 1940s They are currently used in many countries throughout the world at a rate of over 12 million per year This report discusses the various types of sleeper which have been developed monoblock two block reinforced and prestressed concrete Separate sections deal with design rail fastening systems manufacture quality control and testing installation and performance and research and development Concrete Railway Sleepers Bruno Neumann,1963 Precast Concrete Railway Track Systems fib Fédération internationale du béton,2006-01-01 In 1986 the FIP Commission on Prefabrication issued the state of art report Concrete Railway Sleepers which included design considerations manufacturing methods rail fastening systems and field performance During the two decades since that report precast concrete has gained importance in the field of railway track systems for plain track switches and crossings tunnels and other applications Developments in production methods for concrete sleepers in switch and crossing layouts to cope with the complex geometry and the industry s confidence in their performance have contributed to the huge increase in the use of this type of sleeper The use of slab track for high speed track has also grown particularly where either new track is built or where existing track is renewed and long periods of track possession are possible There has also been progress in the development of plant and equipment for the installation renewal and maintenance of concrete sleepers track With machines now able to replace existing track at a rate of 5000 sleepers over 3 km track per day choosing concrete sleepers can reduce the time on site meaning tracks can be reopened quickly whilst reducing labour requirements and costs Today precast concrete is considered to be the best performing and preferred material for railway sleepers due to the following factors long term durability improved geometric retention of track and greater weight vital for high speed and heavy freight lines improved elasticity of track improved ride quality low first cost minimum life cycle cost low cost of maintenance environmental friendliness no chemical treatment required and can be recycled As all aspects of precast concrete railway track systems from design through manufacture to installation and maintenance have progressed since the publication of the FIP report an update was considered timely in order to provide a synthesis of currently available information This new edition covers quality design production durability maintenance and environmental considerations and includes survey on the use of precast concrete track systems in over 30 countries **Railway Applications. extended longevity The book also provides a detailed description of geosynthetics for substructure improvement considering track deterioration caused by particle degradation fouling and impeded drainage New to this second edition are extensive discussions on subgrade soil stabilisation causes and mechanisms of soil fluidisation mud pumping under cyclic loading and preventive and remedial measures to alleviate undue instability of ballast tracks This book should prove most beneficial for final year civil engineering students and for postgraduate teaching and learning It is an ideal supplement for practising railway engineers and researchers engaged in the challenging tasks of future track design for heavier and faster trains
