Abstract

Time to market, competition and manufacturing costs are only some of the reasons why concurrent engineering is an increasingly used methodology for product development. The present paper deals with a case study of university-industry cooperation to develop an improved part for an automotive application, with three main concerns: economic, performance and environmental. Four universities gathered to attack this problem with an automotive company, joined by a technology research center. The very short time span of the project called for the application of concurrent engineering project planning and execution. The brainstorming that ensued resulted in, among other significant outcomes, a new methodology for materials selection. Also, the application of concurrent engineering methods to university-industry collaboration was very successful, regardless of the usual different timings of industry and university.

1 Introduction

Nowadays, any innovation process and particularly product development is a concurrent effort involving engineers, business planners, marketing staff and environmental professionals functioning as integrated teams [Cooper, 2001]. Leading firms are introducing new products with high-perceived quality, forcing other companies to respond accordingly in order to maintain their competitiveness. This dynamic flow of new products is achieved by adopting new product development methods [Rouibah, Caskey, 2003]. Emerging in this context, Concurrent Engineering (CE) is a process in which a number of specialists from different areas work interactively to meet pre-determined targets [Hilmes, Schatz, 2004]. CE philosophy has been discussed since the beginning of the twentieth century, but only in the past decades it has become the main approach in product development, due to the fast development of science and technology and to the increasing multidisciplinary and interdisciplinary nature of current engineering problems [Jian, Oriet, 2005]. Within a product development context the main purposes for CE principles are the creation of products with shortened development process, lower costs and higher quality [Xu, Li, Li, Tang, 2004]. Many studies have been developed in this area; some are focused on information exchange between expertise areas [Yassine, Sreenivas, Zhu, 2006; Wognum, Bondarouk, 2003; Farinha, Gonçalves, Garção, 2003], some explore leadership and team management strategies [Lin, Chai, Wong, Brombacher, 2007; Stach, Pfennig, 2004] and others focus on applications and case studies involving concurrent engineering applied to product development [McBeth, Tennant, Neailey, 2005; Loh, 2005; Xiuchun, Ning, 2005]. Nevertheless, and whatever their approach is, all of them agree that the basic principles of CE rely on concurrent work-flow, cross-functional work teams and early involvement of constituencies, whose competences will be required or will be disturbed at some point along the product development process.

Manufacturing Management Paul M. Swamidass, 2006-09-21 The Encyclopedia of Production and Manufacturing Management is an encyclopedia that has been developed to serve this field as the fundamental reference work Over the past twenty years the field of production and operations management has grown more rapidly than ever and consequently its boundaries have been stretched in all directions For example in the last two decades production and manufacturing management absorbed in rapid succession several new production management concepts manufacturing strategy focused factory just in time manufacturing concurrent engineering total quality management supply chain management flexible manufacturing systems lean production and mass customization to name a few This explosive growth makes the need for this volume abundantly clear The manufacturing industry thinks and acts more broadly than it did several decades ago The most notable change has been the need for manufacturing managers to think in technological strategic and competitive terms This is a very favorable development and it leads to manufacturing success The entries in this encyclopedia include the most recent technical and strategic innovations in production and manufacturing management The encyclopedia consists of articles of varying lengths The longer articles on important concepts and practices range from five to fifteen pages There are about 100 such articles written by nearly 100 authors from around the world In addition there are over 1000 shorter entries on concepts practices and principles The range of topics and depth of coverage is intended to suit both student and professional audiences The shorter entries provide digests of unfamiliar and complicated subjects Difficult subjects are made intelligible to the reader without oversimplification The strategic and technological perspectives on various topics give this Encyclopedia its distinctiveness and uniqueness The world of manufacturing today is increasingly competitive It is apparent that manufacturers must respond to these competitive pressures with technical and strategic innovation This encyclopedia has been developed to help researchers students and those in the manufacturing industry to understand and implement these ongoing changes in the field
