Patients with hospital-acquired infections may die from bacteremia, fungal, viral infection, or hyperinflammatory complications because of an uncontrolled over-activation of the innate immune system with pathological levels of circulating proinflammatory cytokines or from multiorgan failure. In addition to eliciting a robust inflammatory response, it paradoxically renders the host in an immunocompromised state at the late stage of the disease progression. Severe infectious diseases including sepsis and septic shock are among the most common reasons for death in hospitals. Sepsis is an infection-induced syndrome characterized by a generalized inflammatory state and represents a frequent complication in surgical patients and in immunocompromised patients. Sepsis is a common, expensive, and frequently associated with a fatal outcome. Every 3 to 4 seconds somebody dies with sepsis, and it is one of the leading causes of death worldwide.
