

Why Your Capacitor Bank Should be Left Ungrounded

Introduction

Should medium voltage capacitor banks on industrial and commercial power systems be grounded? This question often arises, and the answer is usually no for the following reasons:

- Grounded capacitor banks can interfere with a facilities ground fault protection system and cause the entire facility to lose power (main breaker trip).
- Harmonic currents in the ground path can cause harmonic interference with control and communication systems.
- Capacitor discharge currents may damage nearby surge arresters.

Interference with a facilities ground fault protection system is the primary reason for not grounding a capacitor bank or harmonic filter bank. Although this interference can be reduced or eliminated through system modification, it may require protective coordination analysis, relay changes and/or grounding resistor changes. This adds cost and complexity to the installation and may degrade the sensitivity of the existing ground fault protection system. This bulletin describes how a grounded capacitor bank can interfere with a facilities ground fault protection system and suggest that all banks applied on industrial and commercial power systems be left ungrounded.
