- The prioritization is carried out by assigning ranks to the individual indicators and a compound value (C_p) is calculated. Watersheds with highest C_p are of low priority while those with lowest C_p are of high priority. Thus an index of high, medium and low priority is produced.

Prioritization, Morphometric and Hypsometric Analysis of Subwatersheds Ashokkumar Naralasetty, Maheshwara Babu B., Meerabai K. P., 2014-08-07 Morphometry deals with the management and mathematical analysis of the configuration of the earth's surface and of the slopes and dimensions of its landforms It is used to determine the geometry of the watershed especially among its stream network Morphometry gives a little idea of erodibility of soil Watershed characteristics play a vital role on the hydrologic performance of watersheds Hence a number of parameters which signify the watershed characteristics are evaluated from the topographical maps Various morphometric parameters are computed to evaluate the

geomorphic stage of the basin which is the indication of intensity of erosion from the basin In the case of shortage of hydrologic data morphometric parameters play an important role in predicting the response of the catchment Hypsometric analysis aims at developing a relationship between horizontal cross section area of the subwatershed and its elevation in a dimensionless form For determination of hydrologic variables such as precipitation evaporation etc with respect to the altitude is useful by the hypsometric curve Workshop, Remote Sensing and GIS Applications in Water Resources Engineering, 29-31 August 2001, Lucknow ,2001 Dissertation Abstracts International ,2000
