

# Chapter 6: Assembly language programming: Answers to coursebook questions and to Worksheet questions

Syllabus section covered: 4.2

## From the coursebook

### Task 6.01

The ASCII code for denary zero is 01100000. This is the binary equivalent of denary 48. Subtracting 48 leaves zero. Note that the instruction has a denary value as the operand but this will be converted to a binary value before it is subtracted.

### Task 6.02

For the LDI instruction the original operand is an address, the contents of that address are another address, and the contents of this second address are to be loaded into the accumulator. The overall process is:

```
ACC ← [[[CIR(15:0)]]]
```

However, the instruction must use the MAR when accessing a memory address so the steps could be as follows:

```
MAR ← [CIR(15:0)]
```

```
ACC ← [[MAR]]
```

```
MAR ← [ACC]
```

```
ACC ← [[MAR]]
```

### Extension question 6.01

```
1011 1110
+ 0100 0100
```

```
(1) 0000 0010
```

Flags: N V C

```
0 0 1
```

The addition is handled correctly with no negative or overflow flag set so the processor can ignore the carry bit.
