## Introduction

Concrete has been widely used in building construction because of its strength, durability, economy and fire resistance. It is a composite material consisting of cement, sand, aggregate and water.

The concrete is a brittle material and is weak in tension. It is usually reinforced with steel bars to provide the necessary strength and ductility.

The concrete is a porous material and is susceptible to moisture and air infiltration. This can lead to the formation of cracks and spalling.

## Chemical Damp-Proofing

Chemical damp-proofing is a method of protecting concrete from moisture and air infiltration. It involves the application of a chemical solution to the surface of the concrete.

The chemical solution reacts with the concrete to form a protective layer. This layer is impermeable to moisture and air, and it also provides some protection against fire.

## Attendant Problems

There are several attendant problems associated with chemical damp-proofing:

1. Cracking: The chemical solution can cause the concrete to crack, especially if it is applied to a surface that is already cracked.
2. Spalling: The chemical solution can cause the concrete to spall, especially if it is applied to a surface that is already spalling.
3. Discoloration: The chemical solution can cause the concrete to discolor, especially if it is applied to a surface that is already discolored.
4. Delamination: The chemical solution can cause the concrete to delaminate, especially if it is applied to a surface that is already delaminating.

## Prevention

There are several ways to prevent the attendant problems associated with chemical damp-proofing:

1. Use a high quality concrete: The concrete should be made with a high quality cement, sand, and aggregate.
2. Cure the concrete properly: The concrete should be cured properly to ensure that it is strong and durable.
3. Apply the chemical solution correctly: The chemical solution should be applied correctly to the surface of the concrete.
4. Inspect the concrete regularly: The concrete should be inspected regularly to detect any attendant problems.

## Cracking and Spalling

Cracking and spalling are common problems associated with chemical damp-proofing. They are caused by the reaction of the chemical solution with the concrete.

The chemical solution reacts with the concrete to form a protective layer. This layer is impermeable to moisture and air, and it also provides some protection against fire.

However, the chemical solution can also cause the concrete to crack and spall. This is because the chemical solution reacts with the concrete to form a protective layer that is brittle and weak.
