Sullivan, 2013-05-17 A straightforward easy to read introduction to the finite difference time domain FDTD method Finite

difference time domain FDTD is one of the primary computational electrodynamics modeling techniques available. Since it is a time domain method, FDTD solutions can cover a wide frequency range with a single simulation run and treat nonlinear material properties in a natural way. Written in a tutorial fashion starting with the simplest programs and guiding the reader up from one dimensional to the more complex three dimensional programs, this book provides a simple yet comprehensive introduction to the most widely used method for electromagnetic simulation. This fully updated edition presents many new applications including the FDTD method being used in the design and analysis of highly resonant radio frequency RF coils often used for MRI. Each chapter contains a concise explanation of an essential concept and instruction on its implementation into computer code. Projects that increase in complexity are included ranging from simulations in free space to propagation in dispersive media. Additionally, the text offers downloadable MATLAB and C programming languages from the book support site <http://booksupport.wiley.com>. Simple to read and classroom tested, *Electromagnetic Simulation Using the FDTD Method* is a useful reference for practicing engineers as well as undergraduate and graduate engineering students. **Solutions**

A Synthesized Electrooptic

Directional-coupler Modulator at 1300-nanometer Wavelength with Low Switching Voltage Chanin Laliew, 2002. A low switching voltage electrooptic directional coupler modulator for use in analog optical communication systems at the wavelength of 1300 nanometers was investigated. Conventional optical directional couplers have a pair of their constitutive waveguides running in parallel and thus the coupling between them is constant throughout the length of the structure and this gives rise to an approximate sinc squared amplitude transfer function. This transfer or response function is nonlinear and therefore modulators based on the constant coupling directional coupler may only have a small modulation depth of about 2%–5% for analog communication systems. In this work, the directional coupler was modified by varying the etch depth between the two constitutive waveguides while keeping the spacing between them constant along the length of the structure so that the modulator's response function of the desired form was obtained and exhibited high linearity. Consequently, large dynamic range and low switching voltage operation may be realized with this directional coupler modulator. Based on this concept, the device built in AlGaAs/GaAs semiconductor material was designed, fabricated, and tested. The experimental result shows that the directional coupler modulator which is 1.5 cm long has a switching voltage of about 1.8 volts, one of the lowest values for electrooptic modulators built to date. With further investigation on the RF/microwave characteristics, the directional coupler modulator based on this design might prove to be promising for use in the optical communication mainstream.

Microwave NDT N. Ida,1992-11-30 Microwave testing has been paid only scant attention in the literature as a method for nondestructive testing of materials yet it offers some attractive features especially for the testing of composite and other non metallic materials Microwave techniques have been used in a large number of applications that can be classified as nondestructive testing applications ranging from large scale remote sensing to detection of tumors in the body This volume describes a unified approach to microwave nondestructive testing by presenting the three essential components

of testing theory practice and modelling While recognizing that each of these subjects is wide enough to justify a volume of its own the presentation of the three topics together shows that these are interrelated and should be practiced together While few will argue against a good theoretical background modelling and simulation of the testing environment is seldom part of the NDT training in any method but particularly so in microwave testing The text is divided in four parts The first part presents the field theory background necessary for understanding the microwave domain The second part treats microwave measurements as well as devices and sources and the third part discusses practical tests applicable to a variety of materials and geometries The fourth part discusses modelling of microwave testing Each chapter contains a bibliography intended to expand on the material given and in particular to point to subjects which could not be covered either as not appropriate or for lack of space For engineers applied physicists material scientists *Newsletter* ,1991 **32nd Aerospace Sciences Meeting & Exhibit: 94-0220 - 94-0254** ,1994 Characterization of Two-dimensional High Frequency Microstrip and Dielectric Interconnects Tahera Emilie van Deventer,1992 **A Perturbation Method for Transient Multipath Analysis of Electromagnetic Scattering from Targets Above Periodic Surfaces** Ahmet Kizilay,2000
