

**Microscopy: The investigation of cells**

- All organisms are made of cells
  - o Many organisms are single-celled
  - o Even in multicellular organisms, the cells that make up an organism are similar
- Therefore, the simplest organism is a single-celled one
- All cells are defined by their ability to reproduce cells.

**Microscopy: To study cells, biologists use microscopes and the study of reproduction**

- The structure and cells made of cells progressed with the invention of microscopes in 1665 and their improvement in the 19<sup>th</sup> century
- In a light microscope (LM), visible light passes through the specimen and then through glass lenses
  - o The lenses allow light such that the image is magnified and the eye is able to view a clear image
- Microscopes vary in magnification and resolving power
  - o Magnification is the amount an object is made to be seen
  - o Resolving power is a measure of image clarity
    - o In a microscope the same two points can be perceived separately if distinguished as two separate points
    - o Resolution is limited by the shortest wavelength of the radiation used for imaging
- The structure resolution of light microscope allow LM microscopes using the end of a small spectrum
- Light microscopes can magnify effectively to about 1,000 times the size of the actual specimen
  - o At higher magnification, the image is blurred
- Structures revealed in the LM including those with small distinct and regular particles and components to be studied is called as they exist are
- Using a light microscope to observe individual cells, it cannot resolve much of the internal structure, especially arrangements
- To observe smaller structures, we use an electron microscope (EM), which focuses a beam of electrons through the specimen to view the surface
  - o Because electrons are directly viewed at wavelength used electron microscopes cannot observe structures whose wavelengths than visible light's have been resolved
  - o Therefore, the resolution of a modern EM is equivalent to 100 magnification using but the physical limit is about 0.1 nm
- Transmission electron microscope (TEM) can view directly to study the structure arrangements of EM
  - o In EM we use an electron beam through a thin section of the specimen
  - o The image is focused and magnified by electromagnetic
