December 2004

### Abstract

This paper presents everything you need to know about short-run jump-diffusion (or call it MJD) model. MJD model is one of the first beyond Black-Scholes model in the sense that it tries to capture the negative skewness and excess kurtosis of the log stock price density  $f(t|S_0, T, S_T)$  by a simple addition of a compound Poisson jump process. Introduction of this jump process adds three extra parameters  $\lambda$ ,  $\mu$ , and  $\beta$  to the original BS model's volatility  $\sigma$  to control skewness and excess kurtosis of the  $f(t|S_0, T, S_T)$ .

Murata's original approach for pricing is to use the conditional probability of MJD model and interpret the option price as conditional Black-Scholes type solution. But another approach of the pricing is to use the Fourier transform method by Carr and Madan (1999), which is discussed in Murata (2004).
