**Abstract** Nowadays, many current real financial applications have nonlinear and uncertain behaviors which change across the time. Therefore, the need to solve highly nonlinear, time variant problems has been growing rapidly. These problems along with other problems of traditional models caused growing interest in artificial intelligent techniques. In this paper, comparative research review of three famous artificial intelligence techniques, i.e., artificial neural networks, expert systems and hybrid intelligence systems, in financial market has been done. A financial market also has been categorized on three domains: credit evaluation, portfolio management and financial prediction and planning. For each technique, most famous and especially recent researches have been discussed in comparative aspect. Results show that accuracy of these artificial intelligent methods is superior to that of traditional statistical methods in dealing with financial problems, especially regarding nonlinear patterns. However, this outperformance is not absolute.

## 1 Introduction

The economic and, therefore, the social well-being of developing countries with fairly privatized economies are

highly dependent on the behavior of a country's financial sector. The financial sector is a crucial building block for private sector development. It can also play a significant role in reducing risk and vulnerability and increasing the ability of individuals and households to access basic services, such as health and education, thus having a more direct impact on poverty reduction [1]. The importance of well-functioning financial institutions, and their role in promoting and enabling capital accumulation and economic development, has been understood during at least last century. During these years, researchers in many different areas aimed to facilitate financial sector affairs by making credit and other financial products available, predicting financial trends, simulating financial and investor's behavior, goal evaluation, asset portfolio management, pricing initial public offering, determining optimal capital structure, detecting regularities in security price movements, predicting defaults and bankruptcy, etc. (refer to [2–13]). In this regard, different methods have been used. Generally, these methods can be classified to parametric statistical methods (e.g., discriminant analysis and logistic regression), nonparametric statistical methods (e.g., k nearest neighbor and decision trees) and soft-computing approaches (e.g., artificial intelligent algorithms and rough sets). Recently, artificial intelligent methods (especially ANN) are the most popular tool used in financial markets. In this paper, the literature background of three famous artificial intelligence techniques, i.e., ANNs and ES along with hybrid intelligent methods in financial markets has been studied. ES was used because of its abilities like permanence, reproducibility, efficiency, consistency, documentation, completeness, timeliness, breadth and consistency of decision-making. NNs were used because of their numeric nature, no requirement to any data distribution assumptions (for inputs), capability of updating the data
