**Recent Advances in Numerical Methods for Partial Differential Equations and Applications** Xiaobing Feng, Tim P. Schulze, 2002 This book is derived from lectures presented at the 2001 John H Barrett Memorial Lectures at the University of Tennessee Knoxville The topic was computational mathematics focusing on parallel numerical algorithms for partial differential equations their implementation and applications in fluid mechanics and material science Compiled here are articles from six of nine speakers Each of them is a leading researcher in the field of computational mathematics and its applications A vast area that has been coming into its own over the past 15 years computational mathematics has experienced major developments in both algorithmic advances and applications to other fields These developments have had profound implications in mathematics science engineering and industry With the aid of powerful high performance computers numerical simulation of physical phenomena is the only feasible method for analyzing many types of important phenomena joining experimentation and theoretical analysis as the third method of scientific investigation The three aspects applications theory and computer implementation comprise a comprehensive overview of the topic Leading lecturers were Mary Wheeler on applications Jinchao Xu on theory and David Keyes on computer implementation Following the tradition of the Barrett Lectures these in depth articles and expository discussions make this book a useful reference for graduate students as well as the many groups of researchers working in

advanced computations including engineering and computer scientists Nonlinear Conservation Laws and Applications Alberto Bressan, Gui-Qiang G. Chen, Marta Lewicka, Dehua Wang, 2011-04-19 This volume contains the proceedings of the Summer Program on Nonlinear Conservation Laws and Applications held at the IMA on July 13-31, 2009. Hyperbolic conservation laws is a classical subject which has experienced vigorous growth in recent years. The present collection provides a timely survey of the state of the art in this exciting field and a comprehensive outlook on open problems. Contributions of more theoretical nature cover the following topics: global existence and uniqueness theory of one-dimensional systems; multidimensional conservation laws in several space variables and approximations of their solutions; mathematical analysis of fluid motion; stability and dynamics of viscous shock waves; singular limits for viscous systems; basic principles in the modeling of turbulent mixing; transonic flows past an obstacle and a fluid dynamic approach for isometric embedding in geometry; models of nonlinear elasticity; the Monge problem and transport equations with rough coefficients. In addition, there are a number of papers devoted to applications. These include models of blood flow; self-gravitating compressible fluids; granular flow; charge transport in fluids and the modeling and control of traffic flow on networks.
