*Systems and Conceptual Design of Cantilevers* Lingxiao Han (M. Eng),Massachusetts Institute of Technology. Department of Civil and Environmental Engineering,2014 Cantilevers are a popular way to express form and create unique feature spaces From a design perspective cantilevers are amazing feats for the built environment and structurally present many opportunities However conceptual cantilever design can be a difficult task for Architects and Structural Engineers because there are many structural systems or strategies designers could choose to carry loads to supports This thesis begins with examples of built cantilevers which are distilled into five categories of structural systems These structural systems serve as the beginning of the design process In addition to choosing a structural system there are many parameters of a cantilever that can be altered that all impact the overall structural performance to varying degrees This thesis proposes to study these parameters to better understand how they relate to one another through analytical derivations of global deflection and member forces Secondly with these analytical relationships this thesis attempts to quantitatively measure the effectiveness of each structural system through an optimization sequence that takes into account both material use and deflection criteria This method of optimization can then be applied to particular examples and be used as a systematic approach to conceptual cantilever design A design example is optimized for material weight while satisfying a given deflection criteria as a way to illustrate the differences between each structural system
