Before we start with a formal introduction to blockchain let us take you for a moment to a possible future that should realize sooner than we expect You are on a vacation outside your home country at a shopping mall and receive a notification saying there is a sale on luxurious watches You haven t been to this store before You pick up a watch and you wonder if the watch is genuine and worth the price You start a mobile application and place it on the watch The application recognizes the watch and displays the complete lifecycle of the watch like where it was manufactured and the GPS coordinates where it was designed what is the warranty period how much custom duty you need to pay if any if you bring this watch back to your home country and even showing and comparing similar watches You purchase the watch based on these details and now feel even more connected to the watch brand and establish a trust with the shopping store for selling genuine products Let s consider a complex B2B process like an international trade finance which currently takes days to complete the trade process If the entire workflow is automated self regulated and equipped with enough consensus between various parties carrying out the trade it can provide a window of opportunity for new buyers and sellers to handshake implement and execute trade seamlessly with lot of trust and confidence In the above scenarios that we described earlier and possibly in all our future applications data would be a central point for businesses consumers and even system interaction Now in a data driven world you need to establish trust and compliance between parties you need governance regulation and accountability through automated workflow and digital contracts rather than central authority and finally a piece of technology that can enable to realize this goal Once these basic parameters are enabled it opens endless opportunities to move any value from services to digital assets across the network in a secure and transparent way The technology enabler that can aid in realizing this

opportunity is blockchain We view blockchain as an enabler to provide consensus on data The consensus can be between B2B B2C or C2C We call blockchain an enabler as blockchain alone will not lead to realizing the opportunities we talked about earlier The combinatorial power of blockchain smart contracts and technologies like IoT Artificial Intelligence would enable to deliver value driven intelligent applications While we described our vision we are probably at the first generation of blockchain implementation where technologies are still evolving and use cases are being realized Through this book we aim to provide a reference guide for building blockchain applications The book comprises of three chapters In Chapter 1 we will provide a neutral vision and architecture for blockchain without getting into vendor specific details In chapter 2 and 3 we will demonstrate the working of two widely used blockchain implementations Ethereum and IBM Hyperledger Fabric respectively To summarize as part of the book we will cover the following

- 1 A vendor neutral architecture for building any blockchain applications
- 2 A detailed introduction to Ethereum and its core components We will set up a local instance of Ethereum and build end to end application on Ethereum blockchain using a hands on approach At the end we would cover topics around extension to Ethereum blockchain integration with the external world and the future of smart contracts
- 3 A detailed introduction to IBM Hyperledger Fabric and its core components We would cover the enterprise capabilities provided by Fabric

1 0 At the end we would set up a local instance of Fabric and build an end to end application on Fabric using a hands on approach

COMPREHENSIVE GUIDE TO ENTERPRISE INTERNET OF THINGS (IoT) SUCCESS David Kohen,2019-11-17 The internet of things or IoT is a system of interrelated computing devices mechanical and digital machines objects animals or people that are provided with unique identifiers UIDs and the ability to transfer data over a network without requiring human to human or human to computer interaction A thing in the internet of things can be a person with a heart monitor implant a farm animal with a biochip transponder an automobile that has built in sensors to alert the driver when tire pressure is low or any other natural or man made object that can be assigned an IP address and is able to transfer data over a network Increasingly organizations in a variety of industries are using IoT to operate more efficiently better understand customers to deliver enhanced customer service improve decision making and increase the value of the business History of IoTKevin Ashton co founder of the Auto ID Center at MIT first mentioned the internet of things in a presentation he made to Procter Gamble P G in 1999 Wanting to bring radio frequency ID RFID to the attention of P G s senior management Ashton called his presentation Internet of Things to incorporate the cool new trend of 1999 the internet MIT professor Neil Gershenfeld s book When Things Start to Think

also appearing in 1999 didn't use the exact term but provided a clear vision of where IoT was headed. IoT has evolved from the convergence of wireless technologies, microelectromechanical systems (MEMS), micro services, and the internet. The convergence has helped tear down the silos between operational technology (OT) and information technology (IT), enabling unstructured machine-generated data to be analysed for insights to drive improvements. Although Ashton's was the first mention of the internet of things, the idea of connected devices has been around since the 1970s under the monikers embedded internet and pervasive computing. The first internet appliance, for example, was a Coke machine at Carnegie Mellon University in the early 1980s. Using the web, programmers could check the status of the machine and determine whether there would be a cold drink awaiting them, should they decide to make the trip to the machine. IoT evolved from machine-to-machine (M2M) communication, i.e. machines connecting to each other via a network without human interaction. M2M refers to connecting a device to the cloud, managing it, and collecting data. Taking M2M to the next level, IoT is a sensor network of billions of smart devices that connect people, systems, and other applications to collect and share data. As its foundation, M2M offers the connectivity that enables IoT. The internet of things is also a natural extension of SCADA (supervisory control and data acquisition), a category of software application program for process control, the gathering of data in real time from remote locations to control equipment and conditions. SCADA systems include hardware and software components. The hardware gathers and feeds data into a computer that has SCADA software installed, where it is then processed and presented in a timely manner. The evolution of SCADA is such that late-generation SCADA systems developed into first-generation IoT systems. The concept of the IoT ecosystem, however, didn't really come into its own until the middle of 2010, when in part the government of China said it would make IoT a strategic priority in its five-year plan.

How IoT works: An IoT ecosystem consists of web-enabled smart devices that use embedded processors, sensors, and communication hardware to collect, send, and act on data they acquire from their environments. IoT devices share the sensor data they collect by connecting to an IoT gateway or other edge device, where data is either sent to the cloud to be analyzed or analyzed locally. Thus, these devices communicate with other related devices and act on the information they get from one another, driving business intelligence.
