

Chapter 8: DNA

All genes come together are called a genome

- Gene expression: the information is enclosed in a gene transcribed **TRAN** translated

Cell theory; all cells come from other cells

- Cells reproduce by division
- When cells die as needed: Apoptosis
- Cell division; mitosis

What proteins are involved in DNA replication?

- Helicase and DNA polymerase

Cell division in prokaryotes; binary fission

- Parent cell contains one chromosome
- Dna replicated and attaches the cell membrane
- The membrane growth attaches two points and moves DNA molecules apart from new cell
- Results in two daughter cells which is binary diffusion

Horizontal gene transfer: getting new genes

- Mechanisms include transformation, transduction and conjugation

DNA replication

- Unzip double helix
- Then use each strand as a template

DNA is organized at many levels

- Chromatin is DNA wrapped around histone proteins: packed into chromosomes
- Chromosomes exist in pairs in humans

First step to committing to cell division: DNA duplication

- This occurs in the S phase

Centrosomes duplicate during interphase

Filaments mediate cytokinesis (splitting of cells)

Microtubules: mediate mitosis (pulling apart of sister chromatids)
