Feasibility of Visualization and Simulation Applications to Improve Work Zone Safety and Mobility Manop Kaewmoracharoen, Kelly C. Strong, 2008 Visualization is a relatively recent tool available to engineers for enhancing transportation project design through improved communication decision making and stakeholder feedback Current visualization techniques include image composites video composites 2D drawings drive through or fly through animations 3D rendering models virtual reality and 4D CAD These methods are used mainly to communicate within the design and construction team and between the team and external stakeholders Use of visualization improves understanding of design intent and project concepts and facilitates effective decision making However visualization tools are typically used for presentation only in large scale urban projects Visualization is not widely accepted due to a lack of demonstrated engineering benefits for typical agency projects such as small and medium sized projects rural projects and projects where external stakeholder communication is not a major issue Furthermore there is a perceived high cost of investment of both financial and human capital in adopting visualization tools The most advanced visualization technique of virtual reality has only been used in academic research settings and 4D CAD has been used on a very limited basis for highly complicated specialty projects However there are a number of less intensive visualization methods available which may provide some benefit to many agency projects In this paper we present the results of a feasibility study examining the use of visualization and simulation applications for improving highway planning design construction and safety and mobility
