Neuroinflammatory Mechanisms in Alzheimer's Disease Joseph Rogers,2013-03-11

Research into inflammatory mechanisms that may cause damage to the Alzheimer s disease AD brain has now been ongoing for nearly two decades Some two dozen clinical studies have strongly suggested that conventional anti inflammatory drugs may be useful to delay the

onset or slow the progression of the disorder Moreover virtually all the major systems of the innate immune response appear to be present and most are upregulated in pathologically vulnerable regions of the AD brain These new findings are described in this volume first in overview form followed by chapters on topics of special interest In many ways to understand AD brain inflammation one need only review a text on peripheral inflammation biology leaving out the chapters on humoral mediators and substituting microglia for macrophages In several other key respects however AD brain inflammation is unique due primarily to idiosyncratic interactions of inflammatory mediators and mechanisms with classical AD pathology amyloid peptide A deposits and neurofibrillary tangles NFTs For this reason some key concepts about the inflammation that occurs in AD may warrant discussion in preparation for the more detailed chapters that follow
