

# Perl Best Practices

## Reference Guide

### Code Layout

1. Brace and parentheses in RAR style.
2. Separate your control keywords from the following opening bracket.
3. Don't separate subroutines or variable names from the following opening bracket.
4. Don't use unnecessary parentheses for boolean and ternary/boolean.
5. Separate complex keys or indices from their surrounding brackets.
6. Use whitespace to help binary operators stand out from their operands.
7. Place a semicolon after every statement.
8. Place a comma after every value in a multiple list.
9. Use 78-column lines.
10. Use four-column indentation levels.
11. Indent with spaces, not tabs.
12. Never place two statements on the same line.
13. Code in paragraphs.
14. Don't clobber an `else`.
15. Align corresponding items vertically.
16. Break long expressions before an operator.
17. Factor out long expressions in the middle of statements.
18. Always break a long expression at the operator of the lowest precedence.
19. Break long assignments before the assignment operator.
20. Format cascaded ternary operators in columns.
21. Parenthesize long lists.
22. Enforce your chosen layout style mechanically.

### Naming Conventions

23. Use grammatical templates when naming identifiers.
24. Name functions after their principal job.
25. Mark variables that store references with a `_ref` suffix.
26. Name arrays in the plural and hashes in the singular.
27. Use underscores to separate words in multiterm identifiers.
28. Distinguish different program components by case.
29. Note where the prefix.
30. Abbreviate only when the meaning remains unambiguous.
31. Avoid using inherently ambiguous words in names.
32. Prefix for internal use only' subroutines with an underscore.

### Values and Expressions

33. Use interpolating string delimiters only for strings that actually interpolate.
34. Don't use `++` or `--` for an empty string.
35. Don't write non-character strings in visually ambiguous ways.
36. Use named character escapes instead of numeric escapes.
37. Use named constants, but don't use `constant`.
38. Don't pad decimal numbers with leading zeros.

39. Use underscores to improve the readability of long numbers.
40. Lay out multiple strings over multiple lines.
41. Use a heredoc when a multiline string exceeds two lines.
42. Use a `delimiter` when a heredoc would compromise your analysis tool.
43. Make every heredoc terminate a single uppercase identifier with a standard prefix.
44. When introducing a heredoc, quote the terminator.
45. Don't use backslashes.
46. Reserve `or` for pairs.
47. Don't use commas to separate statements.
48. Don't mix high- and low-priority brackets.
49. Parenthesize every `or` list.
50. Use subtle look-ups to test for membership in lists of strings, not `any()` for membership of lists of anything else.

### Variables

51. Avoid using nonlexical variables.
52. Don't use package variables in your own development.
53. If you're forced to modify a package variable, **localize it**.
54. Initialize any variable you **localize**.
55. **use English** for the few familiar punctuation variables.
56. If you're forced to modify a punctuation variable, **localize it**.
57. Don't use the tags `match` variables.
58. Beware of any modification via `$_`.
59. Use negative indices when creating from the end of an array.
60. Take advantage of hash and array slicing.
61. Use a tabular layout for slices.
62. Factor large key or index lists out of their slices.

### Control Structures

63. Use `break` if, not `goto` if.
64. Reserve `goto` for flow-of-control statements.
65. Don't use `goto` unless, for, while, or until.
66. Don't use `unless` or `until` at all.
67. Avoid C-style for statements.
68. Avoid subscripting arrays or hashes within loops.
69. Never subscript more than once in a loop.
70. Use named locals as explicit for loop iterators.
71. Always declare a for loop iterator variable with `my`.
72. Use `map` instead of for when generating new lists from old.
73. Use `map` and `first` instead of for when searching for values in a list.
74. Use for instead of map when transforming a list in place.
75. Use a subroutine call to factor out complex list transformations.
76. Never modify `$_` in a list function.
77. Avoid cascading `if`.
78. Use subtle look-up in preference to cascaded equality tests.
79. When producing a value, use subtle returns.
80. Don't use `do..while` loops.
81. Repeat as many iterations as possible, as early as possible.
82. Don't control loop structures just to control a control.
83. Use for and while instead of an irregularly created while.
84. Label every loop that is exited explicitly, and use the label with every `next`, `last`, or `redo`.

### Documentation

85. Distinguish user documentation from technical documentation.
86. Create standard POD templates for modules and applications.
87. Internal and externalize your standard POD templates.
88. Put user documentation in source files.
89. Keep all user documentation in a single place within your source file.
90. Place POD as close as possible to the end of the file.
91. Subdivide your technical documentation appropriately.
92. Use block comments for major sections.
93. Use full-line comments to explain the algorithm.
94. Use end-of-line comments to point out subtleties and oddities.
95. Comment anything that has puzzled or tripped you.
96. Consider whether it's better to write than to comment.
97. Use 'invisible' POD sections for longer technical discussions.
98. Check for spelling, syntax, and sanity of your documentation.

### Built-in Functions

99. Don't reorganize sort keys inside a sort.
100. Use `reverse` to reverse a list.
101. Use scalar `reverse` to reverse a scalar.
102. Use `unpack` to extract fixed-width fields.
103. Use `split` to extract simple variable-width fields.
104. Use `unpack %*%_*` to extract complex variable-width fields.
105. Avoid string `eval`.
106. Consider building your sorting routines with `sort` + `callback`.
107. Use `key` `sublist` instead of `index` `sublist`.
108. Make appropriate use of brace notation.
109. Use `glob`, not `q *`.
110. Avoid a new `select` for non-integer slices.
111. Always use a block with a `map` and `grep`.
112. Use the 'non-boolean boolean'.

### Subroutines

113. Call subroutines with parentheses but without a trailing `&`.
114. Don't give subroutines the same names as built-in functions.
115. Always unpack `$_` first.
116. Use a block of nested arguments for any subroutine that has more than three parameters.
117. Use `definedness` or `existence` tests for missing arguments.
118. Resolve any default argument values as soon as `$_` is impacted.
119. Always return scalar to scalar returns.
120. Make transforming subroutines return the 'original' value to scalar context.
121. When there is no 'obvious' scalar context return value, consider `undef` + `chance` instead.
122. Don't use subroutines parentheses.
123. Always return via an explicit `return`.
124. Use a bare `return` to return failure.

### IO

125. Don't use forward filehandles.
126. Use indirect filehandles.
127. If you have to use a package filehandle, **localize it first**.
