ABSTRACT

Ceramic matrix composites (CMC's) constituted of silicon boron oxycarbide (SiBCO) matrix and unidirectional carbon fiber rods as reinforcement phase, were prepared by pyrolysis of carbon fiber rods wrapped in polysiloxanes (PS) or poly(borosiloxanes) (PBS) matrices. The preparation of the polymeric precursors involved hydrolysis/condensation reactions of alkoxyxilanes in the presence or not of boric acid, with B/Si atomic ratio of 0.2 and 0.5. Infrared spectra of PBS showed evidence of Si-O-B bonds at 880 cm^{-1} , due to the incorporation of the crosslinker trigonal units of BO_2 in the polymeric network. X-ray diffraction analyses exhibited an amorphous character of the resulting polymer-derived ceramics obtained by pyrolysis up to $1000\text{ }^\circ\text{C}$, under inert atmosphere. The C/SiOC and C/SiBCO composites have good mechanical and thermal stability, in addition to good adhesion between the carbon fiber and the ceramic phase as observed by SEM microscopy.

INTRODUCTION

Polymer-derived ceramics are presently being studied for application as protective coating (Didenko, 2000), fibers (Sutton, 1992) and ceramic matrix composites (Schiavon, 2004a) because they have outstanding high temperature properties. Indeed, the preparation of ceramic matrix composite (CMC's) from polymeric precursors has been a promising area, due to the possibility to obtain new ceramic materials, whose properties can be tailored to specific needs for long life service and load bearing applications (Krenkel, 2005).

Silicon oxycarbide-(SiOC) and silicon carbonitrides-(SiCN) derived glasses have attracted attention for their peculiar high temperature properties, such as low creep rate (Riedel, 1998) and high thermal stability (Ishikawa, 1998). They are easily produced by thermal degradation of polysiloxane and polysilazanes, respectively, which leads to a random network of covalent Si-C, Si-N and Si-O bonds. These materials showed excellent stability against crystallization. Amorphous SiCN led to $\beta\text{-SiC/Si}_3\text{N}_4$ nanocomposite only above $1450\text{ }^\circ\text{C}$ (Schiavon, 2002a) while SiCO starts to separate into amorphous silica and nanocrystalline (1 nm) $\beta\text{-$
