

# Mechanism of Muscle Contraction

## A Calcium exposes myosin binding sites.

## B Actin-myosin cross-bridges perform a power stroke.

**1** In the relaxed muscle, energy from ATP has been used to move the myosin head into a 'cocked' position. The ADP remains bound to the myosin head.

**2** Calcium binds to troponin, which allows tropomyosin to move, exposing the myosin binding sites on the actin molecules.

**3** Myosin heads bind to the myosin binding sites on the actin molecules, and pull the actin molecule (called the power stroke), while the myosin releases ADP.

**4** New ATP binds to the myosin heads, which breaks the actin-myosin bond at the myosin binding sites.
