

# Balancing Evidence-based Medicine: Weighing the Pros and Cons of Randomized Controlled Trials and Big Data Science

## INTRODUCTION

Research aims to generate answers to relevant questions that can be applied to the population of interest to improve clinical care and outcomes. Whereas in routine practice, care is delivered within the context of several interacting, confounding factors, research designs strive to minimize these variations to discern better “signal” from “noise” and generate valid, patient-centered evidence that contributes to health policy.

Evidence-based medicine (EBM) uses the best available evidence to make decisions about patient care. Traditionally, randomized controlled trials (RCTs) have been considered the gold standard in EBM due to their methodological and statistical rigor allowing for delineating causal relationships between exposure (treatment) and outcomes. However, with the generation of big data from large databases and registries, there has been a growing interest in using big data science to answer research questions or augment trial designs. Both have advantages and disadvantages, and which is better for medical research is being debated.

## EVIDENCE-BASED MEDICINE AND THE ROLE OF RANDOMIZED CONTROLLED TRIALS

EBM involves integrating clinical expertise, patient values, and the best available evidence to make decisions about patient care.<sup>[1]</sup> However, conclusions from systematic reviews and meta-analyses often depend on the quality of included studies and, when poor, can lead to poor-quality conclusions, the “Garbage In, Garbage Out” phenomenon.<sup>[2]</sup> Further, different studies in a meta-analysis may assess different questions or combine dissimilar populations; this heterogeneity may threaten the validity of conclusions drawn. Finally, publication bias relating to smaller trials may influence meta-analysis outcomes. Due to these concerns, it has been argued that well-designed and adequately powered RCTs, when available, may be better to guide clinical decision-making.<sup>[3]</sup>

## WHY PERFORM RANDOMIZED CONTROLLED TRIALS? WHAT ARE THEIR LIMITATIONS?

RCTs are designed to provide unbiased estimates of the effect of an intervention. The primary advantage of well-conducted RCTs is that they provide a high level of internal validity, meaning that the results are likely to be free from bias. Randomization helps ensure that the groups being compared are similar in all important aspects, reducing the risk of confounding. This is because randomization balances

measured participant characteristics and inadequately measured or unseen confounding factors, when done properly. No other study design can achieve this satisfactorily.

However, there are limitations to RCTs. They are often expensive, time-consuming, and may not be feasible for all research questions. For instance, we do not have a definitive answer to whether it is safe to use antidepressants during pregnancy, probably, because it will not be possible to randomize pregnant mothers for an RCT to answer this research question due to ethical reasons. RCTs are also associated with practical limitations, such as difficulty in recruiting participants, dropouts, and compliance issues. In addition, findings from RCTs, owing to their strict selection criteria, may not be generalizable to all populations or settings, limiting their external validity. Lastly, knowledge translation from RCTs to practice takes time.

## BIG DATA SCIENCE: ADVANTAGES AND DISADVANTAGES

Big data science involves the analysis of large and complex datasets to discover patterns and relationships. It allows investigators to integrate large amounts of heterogeneous, complex data from diverse sources such as clinical data, social media information, genetic data, and electronic health records (EHR). In medical research, big data has mainly been used in large observational studies incorporating large amounts of data from one or more sources.<sup>[4]</sup> It is mostly rooted in the 5V model: volume, velocity, variety, veracity, and value.<sup>[5]</sup>

Big data science can be used to identify new risk factors, predict outcomes, and personalize treatments. Big data science has several advantages over RCTs. First, it can be less expensive and faster than conducting an RCT. Second, big data can be more representative of the population and captures a wider range of outcomes than an RCT. Finally, big data can be used to generate hypotheses for further investigation.

However, there are also several disadvantages to big data science. As noted in all observational studies, one of the biggest challenges is the potential for bias and confounding. Big data can be subject to selection bias, where certain groups are overrepresented in the dataset. There is also the potential for confounding, where variables not accounted for in the analysis may be responsible for the observed associations. Another limitation is that big data may not capture all relevant variables, making it difficult to control for all confounders.<sup>[6]</sup> Additional challenges with big data science involve the need for a specialized workforce to handle big data and legitimate
