

# DYNAMIC BALANCING OF ROTATING MACHINERY

## INTRODUCTION TO DYNAMIC BALANCING

Dynamic balancing is a critical process in the design and manufacturing of rotating machinery, aimed at reducing vibration, noise, and wear, and ensuring the longevity and efficiency of equipment. It involves adjusting the mass distribution of a rotating body so that the center of mass aligns with the axis of rotation, minimizing imbalance and its effects.

### KEY CONCEPTS

- Imbalance:** Occurs when the mass distribution of a rotating body is not uniform, leading to vibrations and noise. It can be static or dynamic, depending on the speed of rotation.
- Static Imbalance:** Occurs when the center of mass is not aligned with the axis of rotation, causing a constant vibration.
- Dynamic Imbalance:** Occurs when the mass distribution is not uniform, leading to vibrations that vary with the speed of rotation. It is caused by uneven mass distribution along the length of the rotating body.
- Residual Imbalance:** The difference between the initial imbalance and the imbalance after balancing. It is the amount of imbalance that remains after the balancing process.
- Unbalance Vectors:** Represented by a complex number, it is a vector that represents the magnitude and phase of the unbalance. It is used to calculate the residual unbalance and the required correction.

### BASIC PRINCIPLES OF DYNAMIC BALANCING

Dynamic balancing is a process that involves the following steps:

- Identification of Imbalance:** By measuring vibrations, unbalance is identified. This is done by using sensors and software to measure the magnitude and phase of the unbalance.
- Correction of Imbalance:** Adding or removing mass at specific points to correct the unbalance. This is done by adding or removing mass at the same phase as the unbalance.
