Introduction: It can be rationalized that the most important concept in physical science is like things _____ while opposite things _____. When working with static electric charges, like charges _____ while opposite charges _____. These charges can be as large as clouds of ionized gas in a nebula one million times the size of the earth, or as small as protons and electrons. The rule remains the same. In this lab, you will investigate how a charge creates a field around itself and how test charges behave when placed in that field.

Important Formulas:

$F = Eq$ $F = k \frac{q_1q_2}{d^2}$ $E = V/d$

$k = 9.00 \times 10^9 \text{ Nm}^2/\text{C}^2$

Procedure Part I: Electricity, Magnets, and Circuits → *Charges and Fields* Run Now

- Place a 1 nC (nanoCoulomb) positive charge and E-Field sensor in the test area. Click Show E-field to observe the field lines in the E-field. Observe the sensor's arrow as you drag it around the in the field.
- The sensor's arrow illustrates the **force** of attraction or repulsion at a point in an electric field.
- Replace the positive charge with a negative point charge. To remove charges, drag them back into their box.

By convention, field arrows point _____ a positive charge and _____ a negative charge.

As the sensor gets closer to a point charge, the field strength created by that field _____

- Click on *show numbers* and *tape measure* to measure the distances from a field-creating charge to a test charge. The tape measure can be dragged to a specific distance and placed anywhere on the field.
- When measuring field strength, click plot to show **lines of equipotential**.
- Complete the table below using a single positive or negative charge:

Test charge distance, m	Field strength, V/m	Potential at location, V
1.0 m		
2.5 m		
	1.1 V/m	
4.0 m		

- Add at least three charges, using both positive and negative charges. Move the voltage meter around and *plot* the lines of equipotential. Plot at least ten lines.
- Sketch the multi-charge system
- Show the value of the potential equipotential.

Laboratories in Engineering and Science Education Michael E. Auer, Abul K.M. Azad, Arthur Edwards, Ton de Jong, 2018-04-26 This volume investigates a number of issues needed to develop a modular effective versatile cost effective pedagogically embedded user friendly and sustainable online laboratory system that can deliver its true potential in the national and global arenas This allows individual researchers to develop their own modular systems with a level of creativity and innovation while at the same time ensuring continuing growth by separating the responsibility for creating online laboratories from the responsibility for overseeing the students who use them The volume first introduces the reader to several system architectures that have proven successful in many online laboratory settings The following chapters then describe real life experiences in the area of online laboratories from both technological and educational points of view The volume further collects experiences and evidence on the effective use of online labs in the context of a diversity of pedagogical issues It also illustrates successful online laboratories to highlight best practices as case studies and describes the technological design strategies implementation details and classroom activities as well as learning from these

developments Finally the volume describes the creation and deployment of commercial products tools and services for online laboratory development It also provides an idea about the developments that are on the horizon to support this area
