**Getting Started with Microservices in PHP** Brad Bonkoski,2017 Microservices aka the microservice architecture is an architectural style that structures an application as a collection of loosely coupled services The microservice architecture enables the continuous delivery deployment of large complex applications and enables faster better delivery of value to implement business capabilities thus enabling an organization to evolve its technology stack It enables organizations to scale their products and add or adapt services efficiently Companies can deliver software faster and more efficiently in order to compete in the dynamic markets of today and tomorrow while at the same time keeping their products fast secure and stable Lately microservices have gained far more attention due to their use as the architecture pattern of choice at companies such as Google Facebook Twitter Netflix and many more prominent technology companies and startups The course starts with the basics of microservices and helps you understand the important tools required to develop and validate them Moving ahead we will set up and create the right environment before we start building your microservice The 2nd section is all about testing and will teach you to publish containers The videos cover Docker and Vagrant Finally towards the end you will learn to deploy and monitor your published microservice Resource description page
