

# Kakutani's Fixed Point Theorem

Kakutani's fixed point theorem is a result in **functional analysis** which establishes the existence of a common fixed point among a collection of maps defined on certain "well-behaved" subsets of **locally convex topological vector spaces**. The theorem is relevant both because of its independent theoretical significance and because of other results which stem as corollaries therefrom.

One common form of Kakutani's fixed point theorem states that, given a locally convex topological vector space  $X$ , any **equicontinuous group**  $G = \{g_\alpha\}_{\alpha \in A}$  of **affine maps**  $g_\alpha$  mapping a (nonempty) **compact, convex subset**  $K \subset X$  into itself necessarily has a common **fixed point** in  $K$ , i.e., that under the above conditions, there exists a point  $\mathbf{x} \in K$  satisfying  $g_\alpha(\mathbf{x}) = \mathbf{x}$  for all  $g_\alpha \in G$ . In addition, Markov and Kakutani proved that some of these hypotheses can be weakened without affecting the results, e.g., that the result remains true for arbitrary topological vector spaces  $X$  (which may or may not be locally convex) provided that  $G$  is a **commuting** collection (not necessarily a group, and not necessarily equicontinuous) of **continuous** affine maps from  $K$  into  $K$ .

**The Complex Networks of Economic Interactions** Akira Namatame, Taisei Kaizouji, Yuuji

Aruka, 2006-03-09 Understanding the mechanism of a socio economic system requires more than an understanding of the individuals that comprise the system It also requires understanding how individuals interact with each other and how the aggregated outcome can be more than the sum of individual behaviors This book contains the papers fostering the formation of an active multi disciplinary community on socio economic systems with the exciting new fields of age based modeling and econophysics We especially intend to increase the awareness of researchers in many fields with sharing the common view many economic and social activities as collectives of a large scale heterogeneous and interacting agents Economists seek to understand not only how individuals behave but also how the interaction of many individuals leads to complex outcomes Age based modeling is a method for studying socio economic systems exhibiting the following two properties 1 the system is composed of interacting agents and 2 the system exhibits emergent properties that is properties arising from the interactions

of the agents that cannot be deduced simply by aggregating the properties of the system's components. When the interaction of the agents is contingent on past experience and especially when the agents continually adapt to that experience, mathematical analysis is typically very limited in its ability to derive the outcome. *Proceedings of the National Academy of Sciences of the United States of America* National Academy of Sciences (U.S.), 1915. The book gives a very clear and concise summary of the important fields of sequence transformations and convergence acceleration methods. Some of the outstanding features are precise definitions of algorithmic sequence transformations, a study of the power of sequence transformations, proof of negative results on convergence acceleration methods, namely that some sequence families are not accelerable, new algorithms for convergence acceleration, in particular automatic selection procedures. For researchers and graduate students working in or with convergence acceleration methods and sequence transformations, this book is sure to become an important tool. This book is a contribution to the theory and practice of convergence acceleration methods. It gives a new survey point of view on the subject with positive results, new method of acceleration, and negative results, proofs that some sequence families are not accelerable.

*Applied Nonlinear Analysis* Jean-Pierre Aubin, Ivar Ekeland, 2006-01-01. Nonlinear analysis, formerly a subsidiary of linear analysis, has advanced as an individual discipline with its own methods and applications. Moreover, students can now approach this highly active field without the preliminaries of linear analysis. As this text demonstrates, the concepts of nonlinear analysis are simple, their proofs direct, and their applications clear. No prerequisites are necessary beyond the elementary theory of Hilbert spaces; indeed, many of the most interesting results lie in Euclidean spaces. In order to remain at an introductory level, this volume refrains from delving into technical difficulties and sophisticated results not in current use. Applications are explained as soon as possible, and theoretical aspects are geared toward practical use. Topics range from very smooth functions to nonsmooth ones, from convex variational problems to nonconvex ones, and from economics to mechanics. Background notes, comments, bibliography, and indexes supplement the text. **Mathematica - revue d'analyse numérique et de théorie de l'approximation**, 2003, 1997. *Pacific Journal of Mathematics*, 1978. *Contributions to the Theory of Games* Harold William Kuhn, 1959. **Annals of Mathematics Studies**, 1959.
