Large Scale Inverse Problems Mike Cullen, Melina A Freitag, Stefan Kindermann, Robert Scheichl, 2013-08-29 This book is the second volume of a three volume series recording the Radon Special Semester 2011 on Multiscale Simulation Analysis in Energy and the Environment that took place in Linz Austria October 3 7 2011 This volume addresses the common ground in the mathematical and computational procedures required for large scale inverse problems and data assimilation in forefront applications The solution of inverse problems is fundamental to a wide variety of applications such as weather forecasting medical tomography and oil exploration Regularisation techniques are needed to ensure solutions of sufficient quality to be useful and soundly theoretically based This book addresses the common techniques required for all the applications and is thus truly interdisciplinary This collection of survey articles focusses on the large inverse problems commonly arising in simulation and

forecasting in the earth sciences For example operational weather forecasting models have between 107 and 108 degrees of freedom Even so these degrees of freedom represent grossly space time averaged properties of the atmosphere Accurate forecasts require accurate initial conditions With recent developments in satellite data there are between 106 and 107 observations each day However while these also represent space time averaged properties the averaging implicit in the measurements is quite different from that used in the models In atmosphere and ocean applications there is a physically based model available which can be used to regularise the problem We assume that there is a set of observations with known error characteristics available over a period of time The basic deterministic technique is to fit a model trajectory to the observations over a period of time to within the observation error Since the model is not perfect the model trajectory has to be corrected which defines the data assimilation problem The stochastic view can be expressed by using an ensemble of model trajectories and calculating corrections to both the mean value and the spread which allow the observations to be fitted by each ensemble member In other areas of earth science only the structure of the model formulation itself is known and the aim is to use the past observation history to determine the unknown model parameters The book records the achievements of Workshop2 Large Scale Inverse Problems and Applications in the Earth Sciences It involves experts in the theory of inverse problems together with experts working on both theoretical and practical aspects of the techniques by which large inverse problems arise in the earth sciences
