Abstract: One quarter of bridges in Canada and the United States need repair. The present study provides a critical overview of the state-of-the-art existing condition assessment techniques for reinforced concrete bridges, with an emphasis on current practice in North America. The techniques were classified into five categories, including visual inspection, load testing, non-destructive evaluation, structural health monitoring, and finite element modelling. The potential applications of these technologies are discussed and compared, highlighting their primary advantages and limitations. The review revealed that quantitative assessment could be effectively achieved using several complementary technologies. It is shown that there is need for concerted research efforts to achieve automated data collection and interpretation analyses. Also, the configuration of monitoring systems was found to be paramount in effectively assessing bridge performance parameters of interest. The study suggests appropriate investigation methods for some bridge deterioration mechanisms. Knowledge gaps and challenges in this field are outlined in order to motivate further research and development of these technologies.

1. Introduction

Bridge failures can be catastrophic, both in terms of human life and economic loss. According to the Canadian infrastructure report card (2016), 26% of bridges are in fair, poor or very poor condition, and US \$50 billion needs to be invested for bridge replacement and maintenance. Likewise, about 25% of bridges in the USA are either structurally deficient or functionally obsolete, and \$70.9 billion is needed to address their maintenance [1]. Reinforced concrete (RC) bridges often deteriorate due to ageing, materials and construction defects, exposure to aggressive environments, lack of ductility, and excessive loads. The distinction among their major degradation causes is purely qualitative since such mechanisms can act in synergy. Different deterioration processes lead to different types of defects, which represent the main challenge in bridge inspection programmes. In addition, fire is one of the most severe hazards to which RC bridges may be subjected during its service life. Bridge management systems (BMSs) have been developed to assist decision makers in maximizing the safety, serviceability, and functionality of bridges within available budgets. The basic components of a BMS are illustrated in Figure 1. The architecture of a typical BMS consists of a database, condition and structural assessment modules, a deterioration prediction module, a lifecycle cost module, and a maintenance optimization module. The database stores inventory and appraisal data. The condition assessment module evaluates the existing health condition of the bridge(s). The deterioration prediction module estimates the future condition of bridge components. The life-cycle cost module calculates agency and user costs
