Programming Distributed Computing Systems Carlos A. Varela, 2013-05-31 An introduction to fundamental theories of concurrent computation and associated programming languages for developing distributed and mobile computing systems Starting from the premise that understanding the foundations of concurrent programming is key to developing distributed computing systems this book first presents the fundamental theories of concurrent computing and then introduces the programming languages that help develop distributed computing systems at a high level of abstraction The major theories of concurrent computation including the calculus the actor model the join calculus and mobile ambients are explained with a focus on how they help design and reason about distributed and mobile computing systems The book then presents programming languages that follow the theoretical models already described including Pict SALSA and JoCaml The parallel structure of the chapters in both part one theory and part two practice enable the reader not only to compare the different theories but also to see clearly how a programming language supports a theoretical model The book is unique in bridging the gap between the theory and the practice of programming distributed computing systems It can be used as a textbook for graduate and advanced undergraduate students in computer science or as a reference for researchers in the area of programming technology for distributed computing By presenting theory first the book allows readers to focus on the essential components of concurrency distribution and mobility without getting bogged down in syntactic details of specific programming languages Once the theory is understood the

practical part of implementing a system in an actual programming language becomes much easier **Proceedings of the ACM ... Java Grande/ISCOPE Conference**, 2002 **Designing Concurrent, Distributed, and Real-time Applications with UML** Hassan Gomaa, 2000 Suitable for real world systems that deal with complex issues such as concurrency and real time constraints Providing detailed guidelines this book is useful for software engineers **JGI '02 ACM Special Interest Group on Programming Languages**, 2002 **Foundations of Multithreaded, Parallel, and Distributed Programming** Gregory R. Andrews, 2000 Foundations of Multithreaded Parallel and Distributed Programming covers and then applies the core concepts and techniques needed for an introductory course in this subject Its emphasis is on the practice and application of parallel systems using real world examples throughout Greg Andrews teaches the fundamental concepts of multithreaded parallel and distributed computing and relates them to the implementation and performance processes He presents the appropriate breadth of topics and supports these discussions with an emphasis on performance Features Emphasizes how to solve problems with correctness the primary concern and performance an important but secondary concern Includes a number of case studies which cover such topics as pthreads MPI and OpenMP libraries as well as programming languages like Java Ada high performance Fortran Linda Occam and SR Provides examples using Java syntax and discusses how Java deals with monitors sockets and remote method invocation Covers current programming techniques such as semaphores locks barriers monitors message passing and remote invocation Concrete examples are executed with complete programs both shared and distributed Sample applications include scientific computing and distributed systems 0201357526B04062001 **Concurrent Programming in Java** Douglas Lea, 2000 Software Programming Languages **Distributed Computing** M.
