

# Probability formula

Probability formulas are used to calculate the probabilities of events

Finding the probability of an event A happening can be calculated using the formula

$$P(A) = \frac{\text{Number of times A occurs}}{\text{Total number of possible outcomes}}$$

$$P(\text{not A}) = 1 - P(A)$$

For mutually exclusive events:  $P(A \text{ or } B) = P(A) + P(B)$

For independent events:  $P(A \text{ and } B) = P(A) \times P(B)$

**Elements of Probability and Statistics** Joseph Walker,2018      **Elements of Probability and Statistics** Frank Louis Wolf,1974      *Elements of Probability and Statistics* Francesca Biagini,Massimo Campanino,2016-01-22 This book provides an introduction to elementary probability and to Bayesian statistics using de Finetti s subjectivist approach One of the features of this approach is that it does not require the introduction of sample space a non intrinsic concept that makes the treatment of elementary probability unnecessarily

complicate but introduces as fundamental the concept of random numbers directly related to their interpretation in applications Events become a particular case of random numbers and probability a particular case of expectation when it is applied to events The subjective evaluation of expectation and of conditional expectation is based on an economic choice of an acceptable bet or penalty The properties of expectation and conditional expectation are derived by applying a coherence criterion that the evaluation has to follow The book is suitable for all introductory courses in probability and statistics for students in Mathematics Informatics Engineering and Physics Statistics and Econometrics Joseph Zaremba,1980
