## **Email forensic tools: A roadmap to email header analysis through a cybercrime use case**

### **Keywords**

email forensics, cybercrime, digital forensic tools, digital crime

### **Abstract**

Email is one of the primary sources of numerous criminal activities, on the Internet, of which some threaten human lives. Email analysis is challenging due to not only various fields that can be forged by hackers or the wide range email applications in use, but also due to imposed law restrictions in the analysis of email body. Despite this being a relatively new area, a number of both open source and proprietary forensic tools, with varying possibilities and versatility, have been developed aiding use by practitioners. In this paper, we review existing email forensic tools for email header analysis, as part of email investigation, with emphasis on aspects related to online crime while still considering legal constraints. Through our analysis, we investigate a common case of cybercrime and examine the breadth of information one may gain solely through email forensics analysis. Additionally, a roadmap for email forensic analysis is presented, combining features and functionality already available, to assist the process of digital forensic analysis.

### **1. Introduction**

We span the information age where information is maintained in digital form aiding improved efficiency and productivity [34]. The internet is a network of networks, connecting millions of computing devices [24] performing information interchange throughout the world; producing a large amount of electronic messages. As a result, e-mail has emerged as the most important application on Internet for communication of information, used not only from computers but many other electronic gadgets. Royal Pingdom, which monitors the Internet usage, stated that in 2010, 107 trillion e-mails were sent; that is 294 billion e-mails sent per day [21].

The heavy exchange of electronic messages coupled with the right of anonymity, result in increased number of criminal and terrorism activity [27]

mainly due to two inherent limitations [12]. There is rarely any encryption at the sender end and/or integrity checks at the recipient end, while the widely used e-mail protocol SMTP (Simple Mail Transfer Protocol) lacks a source authentication mechanism. Although there have been many attempts into securing e-mail systems, most are still inadequately secured. Installing antiviruses, filters, firewalls and scanners is simply not enough to secure e-mail communications.

Some common examples of illegitimate uses of emails are spam, phishing, cyber bullying, racial abuse, disclosure of confidential information, child pornography and sexual harassment. In the vast majority of these e-mail cybercrimes the tactics used vary from simple anonymity to impersonation and identity theft. Therefore, a forensic investigator needs efficient tools and techniques to perform the

**Email Forensics** Crow Security, 2022-04-20 Email Communication first evolved in the 1960s and since then emails are being used as the primary communication mode in enterprises for business communication Today a mass number of internet users are dependent on emails to receive information and deals from their service providers The growing dependence on email for daily communication given raise to email crimes Cybercriminals are now using email to target innocent users to lure them with attractive deals via spam emails Therefore forensic investigators need to have a thorough understanding of an email system and different techniques used by cyber criminals to conduct email crimes Email forensics refers to the study of the source and content of emails as evidence to spot the actual sender and recipient of a message data time and intent of the sender In this module of the computer forensics investigation series we will learn various steps involved in the investigation of email crime We will learn to investigate the meta data of malicious emails You will understand port scanning keyword searching and analysis of headers in emails Here

the primary goal for a forensics investigator is to find the person behind the email crime Hence he has to investigate the server of the email network devices software and fingerprints of the sender mailer Further we will understand various components involved in email communication We will learn about mail user agents mail transfer agents and various protocols used to send emails As we know an email system works on the basic client server architecture that allows clients to send and receive emails An email client software helps the sender to compose the mail Most of them have a text editor which helps the sender to compose the email for the receiver Here while composing emails malicious people embed malicious scripts and attach malware and viruses which are then sent to people The goal of this ebook is not to help you set up an email server rather we will focus on understanding the basic functionality of the email server We will understand what components an email system consists of which allows users to send and receive emails Furthermore we will dive deeper into the forensics part to investigate and discover evidence We will understand the investigation procedure for email crimes

**Automation of Email Analysis Using a Database** Jasbinder Singh Bali,2007 ABSTRACT Phishing scams which use emails to trick users into revealing personal data have become pandemic in the world Analyzing such emails to extract maximum information about them and make intelligent forensic decisions based on such an analysis is a major task for law enforcement agencies To date such analysis is done by manually checking various headers of a raw email and running various Unix tools on its constituent parts such as IP addresses links domain names This thesis describes the design and development of a database system used for automation of a system called the Undercover Multipurpose Anti Spoofing Kit UnMASK that will enable investigators to reduce the time and effort needed for digital forensic investigations of email based crimes It also describes how the database is used to perform such automation UnMASK uses a database for organizing a work flow to automatically launch Unix tools to collect additional information from the Internet The retrieved information is in turn added to the database UnMASK is a working system To the best of our knowledge UnMASK is the first comprehensive system that can automate the process of analyzing emails using a database and then generate forensic reports that can be used for subsequent investigation and prosecution

Alassouli,2023-07-01 Simple Mail Transfer Protocol SMTP is a set of rules used while sending emails Usually this protocol is associated with IMAP or POP3 However SMTP is utilized to deliver messages while POP3 and IMAP are utilized to receive them The SMTP testing tool identifies issues with email security in your server that can hinder your email delivery It checks the health status of your outgoing email server and notifies you about the detected problems such as connectivity issues and how to tackle them An SMTP test tool can identify SMTP server issues and troubleshoot them to keep your email secure and safe SSL certificates are what enable websites to use HTTPS which is more secure than HTTP An SSL certificate is a data file hosted in a website s origin server SSL certificates make SSL TLS encryption possible and they contain the website s public

key and the website's identity along with related information. Devices attempting to communicate with the origin server will reference this file to obtain the public key and verify the server's identity. The private key is kept secret and secure. The SSL Checker tool can verify that the SSL Certificate on your web server is properly installed and trusted. Email headers are present on every email you receive via the Internet. The email header is generated by the client mail program that first sends it and by all the mail servers on route to the destination. Each node adds more text including from-to addresses, subject, content type, time stamp, and identification data. You can trace the path of the message from source to destination by reviewing the email header text. Header Analyzers can help you view and analyze message headers by displaying the information in a user-friendly manner and also by calling out various issues such as suspected delivery delays that may require your attention. Microsoft Remote Connectivity Analyzer provides many tests including tests for Inbound and outbound SMTP emails. The Inbound SMTP Email test shows you the various steps taken by an email server to send your domain an inbound SMTP email. Similarly, an Outbound SMTP Email test finds out your outbound IPs for some requirements. It includes Reverse DNS, RBL checks, and Sender ID. ### **Investigating and Implementing an Email Forensic Readiness Architecture** Franscois Ruan Van Staden, 2017

Email forensic investigations rely on the collection and analysis of digital forensic evidence collected from email systems.

Problems arise when the digital forensic evidence needed for the email forensic investigation is no longer available or there is a huge amount of email data that can be collected which take time to sift through to find the digital forensic evidence that is actually needed. The email digital forensic readiness eDFR architecture as proposed in this dissertation endeavours to address these problems. The eDFR architecture is based on the digital forensic readiness process described in ISO 27043. To ensure that the collected email data can be used as digital forensic evidence, a process to validate the collected email data was created. The validation process uses data collected from the email IP headers to validate the data in the SMTP headers ensuring that the SMTP header data was not spoofed or in any way changed. The IP header data is stored in an audit database together with the email data so that the validation process can be executed at any time. An audit database is used to store the collected data to ensure that once the data is stored it cannot be tampered with. The digital forensic evidence collected using the eDFR architecture was found to be useable as part of an email forensic investigation. It was also found to be useful for other processes such as creating a graph representation of email sent and received by an email system or a group of email systems. It was shown that implementing the eDFR architecture could be achieved in an economical way that has almost no impact on current email systems.

**Framework for Extended Acquisition and Uniform Representation of Forensic Email Evidence** Justin W. Paglierani, 2013. The digital forensics community has neglected email forensics as a process despite the fact that email remains an important tool in the commission of crime. Current forensic practices focus mostly on that of disk forensics, while email forensics is left as an analysis task stemming from that practice. As there is no well-defined process to be used for email forensics, the comprehensiveness, extensibility of tools, uniformity of evidence, usefulness in collaborative distributed environments, and consistency of investigations are hindered. At present, there exists little support for discovering, acquiring, and representing web-based email despite its widespread use. To remedy this, a systematic process which includes discovering, acquiring, and representing web-based email for email forensics, which is integrated into the normal forensic

analysis workflow and which accommodates the distinct characteristics of email evidence will be presented This process focuses on detecting the presence of non obvious artifacts related to email accounts retrieving the data from the service provider and representing email in a well structured format based on existing standards As a result developers and organizations can collaboratively create and use analysis tools that can analyze email evidence from any source in the same fashion and the examiner can access additional data relevant to their forensic cases Following an extensible framework implementing this novel process driven approach has been implemented in an attempt to address the problems of comprehensiveness extensibility uniformity collaboration distribution and consistency within forensic investigations involving email evidence

**E-Mail Forensics** Les Hatton, 2011 This is the first book of its kind to document the detailed application of forensic analysis techniques to the field of e mail security Both investigative and preventative techniques are described but the focus is on prevention The world has been subjected to an increasing wave of spam and more recently scamming and phishing attacks in the last twenty years Such attacks now include industrial espionage and government sponsored spying The volume and sophistication of such attacks has rendered existing technologies only partially effective leaving the end user

vulnerable and the number of successful attacks is increasing The seeds of this book were sown three years ago when the author a Professor of Forensic Software Engineering was trying to recover his 20 year old e mail address from the clutches of spammers who had rendered it almost unusable with more than 140 000 junk messages a day It got to the point where he was invited by his ISP to either change it or take it elsewhere Instead he decided to find out how to prevent the deluge acquired his own servers and began researching The book is a mixture of analysis experiment and implementation in almost equal proportions with detailed description of the defence in depth necessary to turn the tidal wave of junk aside leaving only what the end user wants to see no more and no less It covers 1 The rise of e mail 2 How it all works 3 Scams spam and other abuse 4 Protection the principles of filtering 5 Going deeper setting up a mail server 6 Advanced content filtering 7 The bottom line how well can we do 8 Where is all this going There is something here for everyone Chapters 1 4 are suitable for the general reader who just wants to understand how spammers and scammers work and find out a little more about the many forms of attack Chapters 5 and 6 are highly technical and suitable for both e mail administrators and theoreticians and include a discussion of the latest computational and mathematical techniques for detecting textual patterns Chapter 7 presents the results of applying the techniques in this book on the several million junk messages the author s servers received over a 10 month period Chapter 8 tries to see into the future a little to predict how the arms race between the attackers and defenders might go Finally those interested in governance will find discussions of the dangers of release of e mail addresses under Freedom of Information Requests The book contains many illustrations of attacks and is supported by numerous code examples in Perl and C Perfection is impossible but if you follow the advice in this book you can build mail systems which provably make no more than 5 mistakes per million messages received very close to the definitive manufacturing standard of six sigma The threat from viruses effectively disappears and the e mail user is secured from toxic content
