**Problems of the Mathematical Theory of Human Work
(Principles of mathematical modeling in project management)**

By Pavel Barseghyan, PhD

Abstract

In project management there are many problems that need to be updated with fresh approaches to their solution. One of these important problems is the totality of issues related to the methodology of mathematical modeling of projects.

At present, this area is dominated by simple empirical models that are unable to provide answers to the challenging problems of the industry. To further promote the science of project management it is necessary to develop high-level mathematical models, reflecting systemic considerations of projects.

Various tasks in the field of quantitative project management require an equally wide range of mathematical methods. We need to push the boundaries of traditional mathematical methods to make them adequate to the new challenges in project management.

This paper consists of two parts.

The first part of the paper discusses the general methodological issues of the mathematical theory of project management, and the second part is the application of different mathematical methods to the solution of the specific problems of project estimation. In particular discussion is focused on the functional relationships between project total effort, project duration and project staffing.

Introduction

The organization of human labor - it is a problem facing the whole world each day. The degree of rationality of this process is very important because even if a small successful shift in this area may have huge positive consequences. But to achieve sustainability in the organization of the people everyday work is possible only with the full examination of all its aspects.

Of particular importance for this purpose is the development of quantitative methods of human work organization in the background of the existing successful qualitative methods
