

BASIC GASKET APPLICATION GUIDE & MATERIAL SELECTION

Application / Function

Pressure gaskets are generally used to seal and support the integrity of the interface of flanges by either mechanical or chemical means. These concepts show 2 gaskets under different seal types in a pressure vessel application as an example. Both configurations used to increase the quality. A gasket is used to maintain the pressure in a vessel or a liquid throughout the life cycle application. The gasket compresses to provide a sufficient seal and to give it a liquid throughout the life cycle application. This gasket compresses to give the application between the mating surfaces of the vessel. This is done by creating a seal between the gasket and the mating surfaces between the mating surfaces. If the gasket is not installed correctly for a particular application, the quality of the application may be reduced for several reasons.

A correct understanding of the application requirements will enable the gasket designer to optimize the gasket for service in various uses. Every gasket application or design has its own unique characteristics that must be addressed by optimizing the understanding of what the gasket is required to do in the application.
